The tibia has a great cnemial crest and a ridge for the fibula, and its distal end is as in a bird, with a fossa to receive the ascending process of the astragalus. orthochromatic (ôr-thô-krō-mat'ik), *a.* [*Gr. orthôce*, correct, + *chrōma*, color: see *chromatic*.] In *photog.*, correct in the relations or in the rendering of colors—that is, free from the usual photographic fault of exaggerating the deepness of greens, yellows, and reds and the brightness of blues and violets. The epithet notes any process by means of which this end may be attained, or any plate, chemical, etc., used in such a process. Ordinary photographic dry plates in which a trace of such agents as eosin or chlorophyll is incorporated possess the orthochromatic property, which is greatly enhanced if the exposure is made through a transparent screen tinted to correspond with the prevalent color in the scene or picture, as green for a landscape, or yellow for a painting characterized by draperies of that hue. Also expressed by *isochromatic*, an epithet implying equality of exposure to obtain similar results from opposed colors, contrary to the usual photographic experience.

orthochromatize (ôr-thô-krō-mā-tīz), *v. t.* pret. and pp. *orthochromatized*, ppr. *orthochromatizing*. [*Orthochromatic* + *-ize*.] In *photog.*, to render orthochromatic, as a plate; bring into conformity with the conditions necessary to obtain a correct rendering of color-values.

orthoclase (ôr-thô-klāz), *n.* [*Gr. orthôce*, straight, right, + *klāsis*, fracture: see *clastic*.] Common or potash feldspar, a silicate of aluminum and potassium, occurring in monoclinic crystals and also massive. It has two perfect cleavages, at right angles to each other (whence the name). It varies much in color, from white to yellow, red, and green. Adularia, including most moonstone, is a crystallized variety, transparent or nearly so, characteristic especially of the crystalline rocks of the Alps; valencianite, from Valenciana, Mexico, is similar to it. Sanidine is a glassy variety, usually containing more or less of the characteristic of certain igneous rocks, as trachyte, phonolite, etc.; rhyacolite, from Monte Somma, Vesuvius, is similar. Loxolite is a variety from Hammond, New York, and murchisonite one from Exeter, England, the latter showing golden-yellow reflections on a surface nearly parallel to the orthopinacoid. Orthoclase is an essential constituent of granite and some other crystalline rocks, and often occurs in large masses in granitic veins and is then quarried and used in making pottery. Much of the potash feldspar called orthoclase is really the related triclinic species microcline. The name *orthoclase* has been given to some kinds of triclinic feldspar containing considerable potash, which are more closely related to albite than to microcline in optical characters. See *feldspar*. Also called *orthose*.

orthoclastic (ôr-thô-klas'tik), *a.* [*Gr. orthôce*, straight, right, + *klāsis*, verbal adj. of *klān*, break.] Characterized by cleavages at right angles to one another: said of certain species of the feldspar group, particularly orthoclase; pertaining to such species, or specifically to orthoclase.

Orthocella (ôr-thô-sé'llā), *n. pl.* [NL., < *Gr. orthôce*, straight, + *coīlos*, hollow.] One of three orders into which the rhabdocelous turbellarians are sometimes divided.

orthocelic (ôr-thô-sé'lik), *a.* [*Gr. orthôce*, straight, + *coīla*, the belly, the intestines.] Arranged in straight or parallel folds: applied to the intestines of birds when they are thus disposed, in distinction from *cyclocaelic*.

orthodiagonal (ôr-thô-di-ā-gō-nal), *n. and a.* [*Gr. orthôce*, straight, + *diāgonos*, diagonal: see *diagonal*.] *I. n.* In *crystal.*, the diagonal or lateral axis in a monoclinic solid which is at right angles with the vertical axis; also, the plane which includes the two axes named.

II. a. Pertaining to or in the direction of the orthodiagonal.

orthodomatic (ôr-thô-dō-mat'ik), *a.* [*Orthodome* + *-atic*.] Pertaining to or in the direction of an orthodome.

orthodome (ôr-thô-dōm), *n.* [*Gr. orthôce*, straight, + *dōmos*, *dōma*, a house: see *dome*, 5.] In *crystal.*, a dome, in the monoclinic system, parallel to that lateral axis which is at right angles to the vertical axis. It is properly a hemidome, since a given form includes but two planes. See *dome*, 5.

orthodox (ôr-thô-doks), *a.* [= *F. orthodoxe* = *Sp. ortodoxo* = *Pg. orthodoxo* = *It. ortodosso*, < *LL. orthodoxus*, < *LGr. orthodōxos*, having a right opinion, < *Gr. orthôce*, straight, right, correct, + *dōxa*, opinion: see *dogma*, *doxology*.] *1.* Holding what is regarded as the correct opinion, or correct opinions, especially in regard to religious or theological doctrines; sound in opinion or doctrine; specifically, conforming to the faith of the Church Catholic, as represented in its primitive ecumenical creeds: applied to persons or doctrines. That which seems to one part of the Christian church orthodox may be held by another to be heterodox. Thus the Roman Catholic Church regards Protestant churches as heterodox; again, the Reformed churches sometimes deny the title *orthodox* to one another; and generally those who hold to the Trinitarian faith deny the epithet *orthodox* to the Unitarians and Universalists. Orthodoxy is not usually denied to those who are charged with having added articles to the ecumenical faith of Christendom, but only to those who are charged with denying a part of that faith. Thus, the Roman Catholic is not ordinarily refused by Protestants the right to the epithet *orthodox*; nor are Trinitarians denied the right to that epithet by those of Unitarian belief. *Orthodox* is the common epithet of the Greek Church (of which the full official title is "the Holy Orthodox Catholic Apostolic Oriental Church"), and of the Church of the Roman Church. (The word is employed locally in New England to designate the Trinitarian Congregational churches as distinguished from those of the same order which hold the Unitarian or Universalist faith, as in the phrase "the Orthodox Church.") It is also used to distinguish the Trinitarian Quakers from those whose belief is or tends toward Unitarianism.]

'Tis the Orthodox Tenet, that there never was any remission of sins but by the blood of the Lamb that was slain from the beginning of the World.

Milton, *Ans. to Salmasius*, Works, III, 182.

Orthodox school, in *polit. econ.* See *political*.—*Syn. 1. Orthodoxa*, *Evangelical*. The definitions of these terms. It is natural for all who care about their doctrinal beliefs to claim the titles that indicate correctness of belief. Hence *orthodox* is a part of the name of the Greek Church; to the Roman Catholic *orthodox* means faithful to the tenets of the Roman Church; in the doctrinal contests of America *orthodox* has generally meant Calvinistic, especially as opposed to Unitarianism and Universalism; in England it has as generally meant High-Church, as opposed to Low-church or *evangelical*. *Evangelical*, meaning in harmony with the Gospel, has been claimed somewhat similarly and for a like reason, but has been especially applied to those who emphasize the doctrine of salvation by faith in Christ alone.

(Latreille, 1806) (F. *Orthoptères*, Olivier, 1789), neut. pl. of *orthopterus*, straight-winged: see *orthopterus*.] An order of the class *Insecta* proposed by Olivier in 1789 for certain straight-winged insects which Linnaeus had placed in *Hemiptera*, and to which De Geer in 1773 had restricted the order *Hemiptera*, placing the true bugs in a new order *Dermaptera*. The order as now understood contains insects in which metamorphosis is incomplete and wings are almost always present, of which the hinder pair are dilated, folded from the base, and of membranous texture, while the fore pair are more or less coriaceous, usually narrow and straight (but variable in this respect), and thickly veined. These insects are active and capable of feeding in all stages from birth to death. Seven families are as yet considered, and the superfamilies—are now recognized. These are the *Blattidae*, or cockroaches; *Mantidae*, or praying-insects; *Phasmidae*, or walking-sticks; *Gryllidae*, or crickets; *Locustidae*, or long-horned grasshoppers or katydids; and *Aceridae*, or short-horned grasshoppers or true locusts, including the migratory species. (See *locust* for an explanation of the fact that the *Locustidae* are not locusts.) The *Orthoptera* are in the main herbivorous, but the *Mantidae* are carnivorous, and some of the *Blattidae* are omnivorous. They are found all over the world, but most numerous in the tropics, where among them are the largest known representatives of the whole insect class. All the known species are terrestrial or arboreal, no aquatic forms having been discovered; and according to their habitus, mode of progression the families have been grouped by Westwood as *Cursoria*, *Raptoria*, *Ambulatoria*, and *Saltatoria*. The *Orthoptera* are among the earliest forms of insect life to appear in geologic time, and the *Blattidae* in particular are very numerous in some geological formations. The main characters used in classifying the *Orthoptera* are derived from the modifications of the genitals, mouth-parts, and antennae. This form is often separated under the generic name *Sutoria* (which see). Also called *Edeia*. **orthotone** (ôr'thō-tōn), *a.* and *n.* [*< Gr. ôpôotōnos, having the proper accent, < ôpôos, straight, correct, + τόνος, accent: see tone.*] 1. *a.* Retaining or acquiring an accent in certain positions or combinations, but unaccented in others: especially noting proclitics and enclitics when accented.

II. *n.* A word or form, usually enclitic or proclitic, when exceptionally retaining or acquiring an accent. Thus, the English articles, usually proclitics, are orthotones when emphasized: as, I did not say a man, I said the man.

orthotone (ôr'thō-tōn), *v. t.*; pret. and pp. *orthotoned*, ppr. *orthotoning*. [*< orthotone, a.*] To accent (a word usually unaccented).

orthotonesis (ôr'thō-tō-nē'sis), *n.* [*NL., < Gr. ôpôotōnesis, the use of the full accent, < ôpôotonein, write with the proper accent, < ôpôotōnos, having the proper accent: see orthotone.*] Accentuation, under certain conditions, of a word or form usually or in other combinations unaccented; especially, accentuation of a proclitic or an enclitic: opposed to *enclisis*.

Thus the compound (Irish) verb *ad cobrain* is accented (in *orthotonesis*) *adcobrain*, whereas the same compound, used as a verbal noun (infinitive), takes the accent on *ad*. *Amer. Jour. Philol.*, VI. 217.

orthotonic (ôr'thō-ton'ik), *a.* [*< orthotone + -ic.*] Same as *orthotone*.

In all other positions the verb is *orthotonic*—i. e. the accent falls on the verb if there is only one prefix. *Amer. Jour. Philol.*, VI. 218.

Orthotrichae (ôr'thō-trik'ē-ē), *n. pl.* [*NL., < Orthotrichum + -ae.*] A tribe of mosses, taking its name from the genus *Orthotrichum*, characterized by having tufted plants with leaves of close texture, a mitriform, often hairy calyptra, and a simple or double peristome, the outer row of eight bigeminate or sixteen geminate, flat, short, entire or perforate teeth, the inner of eight or sixteen simple filiform cilia or lanceolate segments.

Orthotrichum (ôr'thō-tri-kum), *n.* [*NL. (Hedwig, 1801), so called in allusion to the hairs on the calyptra; < Gr. ôpôos, straight, + θρίξ (thrux), a hair. Cf. ôpôotrichēin, have the hair stand on end.*] A large genus of bryaceae mosses, typical of the tribe *Orthotrichae*. They are perennial plants, growing in tufts on trees or rocks, with usually erect stems covered with crowded leaves, and a generally immersed capsule with peristome of sixteen teeth and calyptra usually covered with straight hairs, from which latter peculiarity they are called *bristle-mosses*. There are nearly 40 North American species.

orthotropic (ôr'thō-trop'ik), *a.* [*< orthotropous + -ic.*] In bot., of or pertaining to or exhibiting orthotropism; growing vertically.

The primary shoot of the seedling (of ivy) is, like that of Tropaeolum, at first orthotropic and radial.

Vines, Physiology of Plants, p. 425.

orthotropism (ôr'thō-rō-pizm), *n.* [*< orthotropous + -ism.*] In bot., vertical growth: a term proposed by Sachs for the habit of those organs of plants which grow more or less nearly vertically, either upward or downward, as iris-leaves, the majority of physiologically radial organs, etc. Compare *plagiotropism*.

Since the light is equally intense on all sides of the shoot, it exerts no directive influence. *Orthotropism* is then mainly due to negative geotropism.

Encyc. Brit., XIX. 61.

orthotropous (ôr'thō-rō-pus), *a.* [*< Gr. ôpôos, straight, + τρέπω, turn: see trope.*] In bot., growing vertically or straight: applied specifically to an ovule in which the chalazal is at the evident base, and the orifice at the opposite extremity, the whole ovule being straight and symmetrical. The ovules of the *Polygonaceae*, *Urticaceae*, etc., are examples. Better *atropal* (which see). Also applied to an embryo in which the radicle is directed to the hilum or to the micropyle close to the hilum, as in an anatropous ovule. In the latter sense the same as *homotropous*.

orthotypous (ôr'thō-ti-pus), *a.* [*< Gr. ôpôos, straight, + τύπος, form, type.*] In mineral., having a perpendicular cleavage.

Orthotropous ovule. Flower of *Juglans nigra*, cut longitudinally and showing the ovule.

Western lauds, but confounded by some Western writers, through a mistaken inference from the meaning of the word ('dawn'), with *matins*. Orthos is a more elaborate office than lauds.

Orthrosanthus (ôr-thrô-san'thus), *n.* [NL. (R. Sweet, 1828), irreg. < Gr. *ôphros*, dawn, + *ânos*, flower.] A plant-genus of the *Iridaceae*, tribe *Sisyrinchieae*, marked by a short woody rootstock, oblong spathes with one to many short-pediceled flowers from each, the filaments free or slightly united at the base. There are 7 species, South American and Australian. They are erect herbs, the grass-like or rigid leaves mostly radical. The plants of the genus are called *morning-flower*, especially the Australian *O. multiflorus*, a pretty plant with sky-blue flowers.

ortive (ôr'tiv), *a.* [= F. *ortive* = Sp. Pg. *It. ortivo*, < LL. *ortivus*, of or belonging to rising, < L. *oriri*, pp. *ortus*, rise: see *orient*.] Rising; relating to the rising of a star; orient; eastern.

The birds are in such demand by epicures that great numbers are caught alive and fattened in confinement for the table, being fed with grain in darkened rooms.

Not one that temperance advances,
Cramm'd to the throat with ortolans.

Pope, *Imit.* of Horace, I. vii. 62.

(a) The bobolink, reed-bird, or rice-bird of the United States, *Dolichonyx oryzivorus*, belonging to the family *Troglodytidae*: so called in the fall, when both sexes are of a yellowish color and not distinctly resemble the true ortolan, being of about the same size, very fat and delicate in flesh, and in great repute for the table: reed-bird, however, is the usual name at this season in most parts of the United States. See cut under *bobolink*. (b) The soot or sora rail, *Porzana carolina*, a wading bird of the family *Rallidae*, which throngs the marshes of the Atlantic coast of the United States early in the fall, at the same time that the reed-birds are in season, and is likewise in great demand for the table. A variety of this, *O. v. floridae*, is found in Florida, and another variety, *O. v. texana*, in Texas. There are several Mexican species, as *O. graysii* and *O. ridgwayi*; the latter also occurs over the Arizona border. But, with such exceptions, the partridges or quails of the southwest belong to other genera, as *Oreortyx*, *Lophortyx*, *Callipepla*, and *Cyrtonyx*. The genus *Ortyx* is often called *Collins*. Orvietano, or Venice tracle, as it was sometimes called, was understood to be a sovereign remedy against poison; and the reader must be contented, for the time he peruses these pages, to hold the same opinion, which was once universally received by the learned as well as the vulgar.

Scott, *Kenilworth*, xiii. note.

This term was formerly used to some extent by writers in English on geological and mineralogical topics, but rarely except in translating from French or German, the word being considered the equivalent of the French *oryctognosie* and the German *Oryktognosie*, with the corresponding adjective form *oryctognostic*. These words, as well as *oryctography*, were somewhat extensively used by

Continental geologists, in the early part of the nineteenth century, with a meaning nearly equivalent to what is now comprehended under the terms *mineralogy* and *lithology*; and this also included more or less, according to the usage of various authors, of economical and mining or "applied" geology. The terms corresponding to *oryctography* and *oryctology* have been dropped from the Continental languages for fully fifty years, and the use of the words in English became correspondingly rare. The beisa antelope, *O. beisa*, is one of the best-known, supposed by some to have furnished the original of the unicorn of the ancients, the long horns seen in profile appearing as one. It inhabits North Africa, where is also found *O. leucoryx*, the algalzel. The South African representative is *O. capensis* or *O. gazella*, the well-known gemsbok of the Dutch colonists. osculate (os'kū-lāt), *v.*; pret. and pp. *osculated*, ppr. *osculating*. [*< L. osculatus*, pp. of *osculari*, kiss, *< osculum*, a little mouth, a pretty mouth, a kiss, dim. of *os*, a mouth: see *os²*, *oral*, etc.] 1. *trans.* 1. To salute with a kiss; kiss. *Imp. Dict.*—2. In *geom.*, to have a higher contact with; touch as closely as possible. Thus, a plane or a circle is said to *osculate* a curve when it has three coincident points in common with the curve, that is, it occupies such a position and in the case of the circle has such a size that as it is brought up into this position three points of intersection with the curve run into one. A sphere is said to *osculate* a tortuous curve when it has four coincident points in common with the curve. In these cases, to *osculate* means to have the greatest number of coincident and successive points common to a fixed locus which is compatible with the general character of the locus which osculates; and some geometers restrict the word to this meaning. This meaning is also extended to time: thus, the *osculating* elements of a planet are those elliptic elements which would satisfy three exact observations made at times infinitely little removed from a given epoch. But *osculate* is also used loosely to mean merely that the last in question have three or more coincident points in common. A tangent-line or plane is never said to *osculate* a curve or surface unless it has more than ordinary contact with it.

II. intrans. 1. To kiss one another; kiss. *Imp. Dict.*—2. In *geom.*, to have, as two loci, three or more coincident and successive points in common. See I., 2.—3. He is son of Seb and Nut, or Heaven and Earth. His antagonist is Set, the deity of evil or darkness, by whom he is slain; but he is avenged by Horus, and reigns in the lower world. With him was formally identified every departed soul in its nether abode, to be protected by him in the necessary conflict with the genius of evil. The worship of Osiris was extended, at about the beginning of the Christian era, over Asia Minor, Greece, and Rome. In art Osiris is usually represented as a mummy, wearing the crown of Upper Egypt, often flanked by ostrich-plumes. osmose (os'mōs), *n.* [*osmosis*, < Gr. *ὀσμός*, impulsion, pushing, < *ὀσμεν*, thrust, push, impel.] The impulse or tendency of fluids to pass through porous partitions and mix or become diffused through each other; the phenomena attending the passage of fluids, whether liquids or gases, through a porous septum. It is a kind of diffusion (see *diffusion*), and includes *endosmosis* and *exosmosis*—the former being distinguished either as the tendency of the outer fluid to pass through into the inner, or as the action of that fluid which passes with the greater rapidity into the other. When two saline solutions differing in strength and composition are separated by a porous diaphragm or septum of bladder, parchment-paper, or porous earthenware, they mutually pass through and mix with each other; but they pass with unequal rapidities, so that after a time the height of the liquid is not the same on both sides. These phenomena are explained by the unequal molecular attraction exerted between the capillary apertures in the porous diaphragm and the different liquids experimented upon.

The specific gravity of the artificially obtained metal has been found to be 22.477; hence it is the heaviest of those bodies. It has never been fused. Its crystalline form is either that of the cube or that of a very obtuse rhombohedron. The crystals are of a bluish-white color, with a violet luster, and are harder than glass. Osmogenes consist substantially of cells separated by partitions of parchment-paper, which causes endosmotic and exosmotic action as explained under *osmose*. The differences in construction do not affect the principle of action. See *colloid* and *crystalloid*. Also called *osmotic*.

large hawk, nearly or quite 2 feet long, and 4½ feet in extent of wings, of a dark Vandyke brown above, the feathers more or less laced with white, the head, neck, and under parts white, with blackish streaks on the crown, a blackish postocular stripe on the nape, and the breast more or less covered with dusky spots. The coloration varies much in the relative amounts of light and dark colors, and the young are darker than the old birds. The feet are very large and roughly granulated, and the talons are all of great size; the outer toe is versatile. The osprey builds a bulky nest in a tree, on a rock, or on the ground, and the nests sometimes acquire enormous dimensions from yearly repairs and additions. The eggs, two or three in number, average about 2.5 by 1.75 inches in size, and are usually heavily marked with various shades of browns and reds. The fish-hawk, as its name implies, feeds on fish, which it catches by plunging from on the wing. Also called *fish-hawk*, *fish-eagle*.

2t. Capable of being shown; that may be shown; proper or intended to be shown.—**Ostensible partner**, in law, a partner whose name is on the books and who appears to the world, as such, as distinguished from a secret or dormant partner; also used in distinction from one so known who is really not such, called a *nominal partner*. = *Syn. 1. Ostensible, Colorable, Specious, Plausible.* The first three of these words are drawn from that which is addressed to the eye, *plausible* from that which is addressed to the ear. *Ostensible* is, literally, that may be or is held out as true, real, actual, or intended, but may not be so; thus, a person's *ostensible* motive for some action is the motive that appears to the observer, and is held out to him as the real motive, which it may or may not be. *Colorable* suggests the possibility of giving the color or aspect of one thing to another, especially of giving the appearance of truth or justice; it has a bad sense, but approaches a good one in the following: "All his [James I. of Scotland's] acquisitions, however fatal to the body of the nobles, had been gained by attacks upon individuals; and, being founded on circumstances peculiar to the persons who suffered, might excite murmurs and apprehensions, but afforded no *colorable* pretext for a general rebellion" (*Robertson*, quoted in *Crabbe*, p. 218). The word is much the least often used of the four. *Specious* is superficially fair, just, or correct, appearing well at first view but easily proved unsound. *Plausible* is applied to that which pleases the ear or the superficial judgment, but will not bear severe examination. *Ostensible* reasons; *colorable* claims; *specious* means; *plausible* explanations.

A political measure employed under restrictions of law among the ancient Athenians, by which citizens whose presence seemed embarrassing to the state were banished by public vote for a term of ten years, with leave to return to the enjoyment of their estates at the end of the period. It has its name from the tablet of earthenware (*ostrakon*) on which every voter wrote the name of the person he desired to ostracize. Ostracism was practised in some other democratic states of Greece, as Argos and Megara, but the method of its administration, except in Athens, remains obscure. Compare *petalism*.

It is characterized by a large, hard, and often plicated bivalve shell or appendage-like valves, consisting of two unequal lateral parts of an unsymmetrical carapace, movably joined together and often peculiarly ornamented; a rudimentary abdomen; a very small shell-gland; the body not ringed, ending in a blind tail; very few thoracic appendages (generally two or three), not foliaceous, but cylindrical, like the legs of higher crustaceans; branchiae attached to the oral appendages, when present, median and coalesced or lateral and separate; and antennules and antennae large and subserving locomotion. The *Ostracopoda* are mostly minute fresh-water crustaceans, swimming very actively by means of their antennae; some carry their eggs about with them like ordinary *Crustacea*, but most attach them to foreign substances, as aquatic plants. These crustaceans are common in all geological strata from the earlier Paleozoic formations, and appear to have undergone little modification. There are several families and a number of genera, such as *Cypris* and *Cythere*. Also called *Ostracoda* and *Ostracopoda*. See cuts under *Cypris* and *Cythereidae*.

This distinction of two interior vehicles or tunics of the soul, besides that outer vestment of the terrestrial body (styled in Plato *τὸ σαρκενόν*, the crustaceous or *ostreaceous* body), is not a mere figment of the latter Platonists since Christianity, but a tradition derived down from antiquity. Cudworth, Intellectual System, p. 790.

Ostreidae (os'trē-i-dē), *n. pl.* [*NL.* < *Ostrea* + *-idae*.] A family of monomyarian bivalve mollusks, the oysters, typified by the genus *Ostrea*, to which various limits have been assigned. (a) In Woodward's and older systems, a large group including all forms with the mantle quite open, a very small

foot or none, an inequivalve shell, free or adherent to foreign bodies, resting on one valve, with central beaks, internal ligament, single adductor muscle, and obscure pallial line. Thus it included not only the *Ostreidae* proper, but also *Anomidae*, *Placunidae*, *Fectinidae*, *Limidae*, and *Spondyliidae*. (b) Now restricted to oysters which have the mantle-margin double and finely fringed, nearly equal gills united to one another behind, and the mantle-lobes forming a complete branchial chamber. The shell is irregular, being both inequivalve and inequilateral, attached by the left valve, and the ligament-cavity is triangular or elongated. In structure the shell is subnucous, and laminated with prismatic cellular substance. Thus limited the *Ostreidae* contain only the oysters and closely related bivalves, of which there are many species, extinct and extant. Pearl-oysters belong to a different though related family, *Aviculinidae*.

ostreiform (os'trē-i-fōrm), *a.* [*L. ostrea*, *a shell*, + *forma*, *form*.] Oyster-like; resembling an oyster in form; ostraceous.

'camel-bird', so called with ref. to its long neck, < *στρουθός*, *a bird*, esp. a sparrow; cf. *ὁ μέγας στρουθός*, lit. 'the great bird', *στρουθός κατάγειος*, 'ground-bird', *στρουθός χειρᾶιος*, 'land-bird', *στρουθός Λιβυκός*, 'Libyan bird', *στρουθός Ἀραβίος*, 'Arabian bird', or simply *στρουθός*, all applied to the ostrich. From the *LL. struthio* are also *AS. struta* = *OHG. MHG. strūz*, *G. strauz*; also, after *MHG.*, *MLG. strūs* = *D. struis* = *Sw. struts* = *Dan. struds*; also *It. struzzo*, dim. *struzzolo* = *OF. strucion* (> *ML. reflex strucion* (*n.*) and *ME. strucion*), *ostrich*.] A very large ratite bird of the genus *Struthio*. The true or African ostrich (*S. camelus*).

A Male Ostrich (*Struthio camelus*).

(*us*) inhabits the sandy plains of Africa and Arabia, and is the largest of all existing birds, attaining a height of from 6 to 8 feet. The head and neck are nearly naked, and the quill-feathers of the wings and tail have their barbs wholly disconnected. It is chiefly for these plumes, which are highly esteemed as articles of dress and decoration, that the bird is hunted and also reared in domestication. The legs are extremely strong, the thighs are naked, and the tarsi are covered with scales. There are only two toes, the first and second being wanting. The pubic bones are united—a conformation occurring in no other bird. The wings are of small size and incapable of being used as organs of flight; the birds can run with extraordinary speed, distancing the fleetest horse. The food consists of grass, grain, and other substances of a vegetable nature. Ostriches are polygamous, every male consorting with several females, and they generally keep together in larger or smaller flocks. The eggs are of great size, averaging three pounds each in weight, and several hens often lay in the same nest, which is merely a hole scraped in the sand. The

eggs appear to be hatched mainly by incubation, both parents relieving each other in the task, but also partly by the heat of the sun. The South African ostrich is often considered as a distinct species under the name of *S. australis*. Three South American birds of the genus *Eleus* are popularly known as the *American ostrich*, though they are not very closely allied to the true ostrich, differing in having three-toed feet and in many other respects. The best-known of the three is *R. americana*, the *nandu* or *nanuquaga* of the Brazilians, inhabiting the great American pampas south of the equator. It is considerably smaller than the true ostrich, and its plumage is much inferior. *R. darwini*, a native of Patagonia, is still smaller, and belongs to a different subgenus (*Ptilocnemis*). The third species is the *R. macrorhyncha*, so called from its long bill; it is perhaps only a variety of the first.

The daughter of my people is become cruel, like the ostriches in the wilderness. Lam. iv. 3.

should impair it. *Nineteenth Century*, XXIV. 704.

der *Fera*, family Mustelidae, and subfamily Lutrinae. There are several genera, as *Barangia* (or *Leptonyx*), *Aonyx*, *Lontra* (or *Soricotora*), *Lutra* proper, *Hydrogale*, and *Pteronura*. They all have large flatish heads, short ears, webbed toes, crooked nails, and tails slightly flattened horizontally. The common river-otter, the *Lutra vulgaris* of Europe, is a quadruped adapted to amphibious habits by its short, strong, flexible, palmated feet, which serve as oars to propel it through the water, and by its long and strong tail, which acts as a powerful rudder, and enables the animal to change its course with great ease and rapidity. It inhabits the banks of rivers, and feeds principally on fish. When its retreat is found, the otter instantly takes the water and dives, remaining a long time underneath it, and rising at a considerable distance from the place where it dived. The weight of a full-grown male is from 20 to 24 pounds, and its length is about 2 feet exclusive of the tail. In many parts of England, and especially in Wales, the otter is hunted with dogs trained for this purpose. The other species of *Lutra* proper, which are found in different parts of the world, do not differ greatly from the European otter. The American otter is a quite distinct species, *Lutra (Lutra) canadensis*. Some Asiatic otters with reduced claws constitute the genus *Aonyx*. There are South American otters, as *Lutra brasiliensis* and *L. chelonis*. The most remarkable form is the winged-tailed or margin-tailed otter

of South America, *Pteronura sandbachi*. The fur of otters is valuable. One kind of it, from South America, is known as *nudra*.

-ous. [ME. *-ous*, *-ouse*; < OF. *-os*, *-us*, *-us*, later *-eux*, *-eux* = Sp. Pg. *-oso*, < L. *-osus*, for **-onsus*, orig. (Aryan) **-wansa*, **-wanta*, a suffix (equivalent to E. *-ful* or *-yl* or *-ed*2) attached to nouns to form adjectives noting fullness, as in *callosus*, hard-skinned, callous, *famosus*, noted, famous, *generosus*, well-born, generous, *odiosus*, hateful, odious, *religiosus*, scrupulous, religious, *sumptuosus*, costly, sumptuous, *viciosus*, faulty, vicious, etc.] A suffix of Latin origin, forming, from nouns, adjectives denoting fullness or abundance, or sometimes merely the presence, of the thing or quality expressed by the noun, as in *callosus*, *famosus*,

generous, *odious*, *religious*, *sumptuous*, *vicious*, etc. (see etymology). Many modern English adjectives taken directly from the Latin have *-ose*, as *juvose*, *serbese*, with or without an equivalent form in *-ous*, as *herbese* *herbous*, *onerosse* *onerous*, *vinose* *vinous*, *apicose* *apicose*, etc., the form in *-ose* being especially common in botanical terms. By reason of the agreement in the terminal pronunciation of English adjectives in *-ous* and the English pronunciation of Latin adjectives in *-us* (in Latin a mere nominative termination), many such adjectives in *-us* have been transferred into English with the accommodated termination *-ous*, as *anciosus*, *conspicuosus*, *deviosus*, *obvious*, *previosus*, *seriosus*, etc., from Latin *anciusus*, *conspiciuosus*, *deviosus*, *obvious*, *previosus*, *seriosus*, etc. So with Latin or New Latin adjectives in *-us* from Greek *-os*, as in *accephalous*, etc. The suffix *-ous* is felt as an English formative only when a noun accompanies the adjective, as in *famosus*, *religiosus*, *ambitious*, etc., associated with the nouns *fame*, *edious*, *religion*, *ambition*, etc. It is sometimes used (as also *-ose*), as an English formative, attached to words of non-Latin origin, as in *quartzous* or *quartzose*, etc.

outcrop (out-'krop), *n.* The appearing at the surface of a stratum or series of strata, or of a vein or ore-deposit of any kind. This is called by Cornish miners the *broil*. The outcrops of many veins, on the other hand, are very conspicuous, especially when the amount of ore present is small, quartz forming the predominating vein-stone of a large proportion of the mineral deposits, and being very intractable. The outcrops of the stratified formations depend on the amount of inclination of the beds. When these lie quite horizontal, there can be no outcropping edges of the strata, except when the formation has been cut into by erosion. The position on the surface of any outcrop depends, therefore, on the inclination of the bed or vein in question, and on the nature and amount of the erosion which has taken place. In capital cases, as treason or felony, failure to appear was a sufficient evidence of guilt, and process of outlawry thereon entailed forfeiture of his personal estate. *Forfeiture* is a term of similar meaning in Scots law.

A *sketch* fills up the *outline* to a greater or less degree, not completely, but so that a lively idea of the original object or scene is conveyed. *Delineation* is rather indefinite, but is more than an *outline* and may be complete. *Outline*, *sketch*, and *delineation* bear the same relation to one another when used to express the representation of a subject in words.

That part of a female animal in which ova, eggs, or germs are generated and matured; the essential female organ of reproduction, corresponding to the testes of the male; the female genital gland or germ-gland; the ovarium. In vertebrates the ovary is a glandular organ, usually paired, sometimes single, and morphologically identical with the testes, both these organs being developed from a primitively indifferent genital gland common to both sexes, the differentiation of this structure into ovary or testes being the fundamental distinction of sex upon which all other sexual differences are consequent. The ovary consists of its proper stroma or capsule peculiar to itself, in which the ova are produced, bound up in ordinary connective tissue, supplied with appropriate vessels or nerves, and fixed in the abdominal cavity by means of a mesentery. With the ovary is usually but not always associated a special structure, the *oviduct*, serving to convey away the eggs. The ovary is relatively largest in those animals which lay multitudinous eggs, as fishes, in which it is known as the *roe*. It is also large in oviparous animals which lay large meroblastic eggs with copious food-yolks, as birds and most reptiles. It is very small in mammals. The ovary in woman is a flattened ovoid body about 1 1/2 inches long, 1/2 inch wide, and 1/4 inch thick, resting on the broad ligament of the uterus and closely connected both with the Fallopian tube and with the Fallopian tube or oviduct. Among invertebrates in which there is distinction of sex, the name *ovary* is applied to any part of the body which can be recognized as having the function of ovulation. Such organs are of almost endlessly varied character in all but the one essential physiological respect. Several kinds of ovaries receive specific names; and in many cases the analogy to

the part of a plant called the ovary (see def. 2) is striking. See cuts under *Dibranchiata* and *Nematodea*.

2. In *bot.*, a closed case or receptacle, the lower section of the pistil, inclosing the ovules or young seeds, and ultimately becoming the fruit. Structurally the ovary is a modified leaf which is folded involutely so as to form a cavity, and with the style and stigma it constitutes the female sexual organs (gynaeceum) of flowering plants. The ovary may be simple (that is, composed of a single leaf), or compounded of two or more leaves. The modified part of the interior of the ovary which bears the ovules is called the *placenta* (which see).

The phrases *superior* and *inferior* ovary are used to designate the position of the ovary in relation to that of the floral envelopes: thus, *ovary superior* is that in which the other parts of the flower are inserted upon the axis below the ovary; *ovary inferior* is that in which the other parts of the flower are inserted above, seemingly upon the ovary. See cuts under *anthophore*, *Araceae*, *Didymamia*, *dimersus*, and *myrtle*.

oven (uv'n), *n.* [*ME. oven*, < *AS. ofen*, *ofn* = *OFries. oven* = *D. oven* = *MLG. oven*, *LG. awen* = *OHG. ovan*, *ofan*, *ovin*, *MHG. oven*, *G. ofen* = *Icel. ofn*, *omn*, *ogn* = *OSw. ofn*, *omn*, *ogn*, *Sw. ugn* = *Dan. oven* = *Goth. aukns*, an oven, = *Gr. ἰνός* (for **ινός*), an oven, furnace, kitchen; cf. *Skt. ukhâ*, a pot; *AS. ofnet*, a closed vessel.] 1. A chamber or receptacle in which food is cooked by the heat radiated from the walls, roof, or floor. (a) A chamber built of brick, tiles, or the like, and usually heated by fuel which is allowed to burn away before the food is introduced, the cooking being done by the heat retained. (b) A chamber for baking or cooking in a cooking-stove, range, or furnace, the heat being usually transmitted through one or more of the sides.

In stead of bread they drie a kind of fish which they beat in mortars to powder, and bake it in their *ovens*, untill it be hard and drie.

Holinshead, Descrip. of Britain, I. x.

2. In general, any inclosed chamber adopted to or used for applying heat to raw materials or to articles in process of manufacture. The heat so applied may be radiated from the previously or continuously heated walls of the inclosure, or it may be derived from currents of heated air, or gases, or superheated vapors circulated through the oven, from interior or exterior coils of pipes heated by steam or hot water, or from the solar rays. The name *oven* is given to a great variety of structures and devices employed in domestic industry, in chemical operations, and in the mechanical arts. Specifically—(a) A kiln. (b) A muffle-furnace. (c) A leer. 3. A furnace.

The king's servants, that put them in, ceased not to make the *oven* hot with rosin, pitch, tow, and small wood; so that the flame streamed forth above the furnace forty and nine cubits.

Song of the Three Holy Children (Apocrypha), v. 23.

4. An oven-bird or its nest.—**Air-oven**, an oven in which baking or drying is done by circulating heated air through it. It is much used in laboratories and in the arts. In some cases, as in drying gelatin plates for photography, the air is filtered on its way to the oven by passing it through cotton-wool. In air-ovens the air may be heated prior to its admission, or by interior heating appliances.—**Annealing-oven**, an oven used for annealing, as the heat of glass-manufactories for slowly cooling glass, which, if cooled rapidly, would be exceedingly brittle; or, as in the manufacture of malleable iron-castings, the inclosure in which the articles, after casting, are treated to render them malleable.—**Bakers' oven**, an oven used by bakers in baking bread, biscuits, crackers, and other articles of food. The principal oven used by bakers is a brick reverberatory oven with an arched roof, but in the manufacture of biscuits, crackers, wafers, etc., on a large scale, reel-ovens and rotary-ovens are used.—**Beehive oven**. See *beehive*.—**Brick oven**, an oven constructed of brick, in contradistinction to an oven made of metal or other material. Brick ovens usually apply their heat from their walls previously heated by an interior fire, which is withdrawn prior to putting in the article to be baked. Such an oven for domestic use was once very common in dwellings, and was generally built at the side of or in close proximity to the chimney then in use. It often projected from the exterior of the building, and this construction is still to be seen in many old country houses. It has a smoke-uptake in the upper part of the mouth and a flue leading from the uptake, and connects at its upper end with the fireplace-chimney. Wood is the fuel used, and when the fire is kindled the air draws into the mouth and passes over the bottom of the oven, while the heated gases of combustion rise to the top and pass forward to the uptake.—**Bush-oven**, the long-tailed titmouse or oven-bird, *Acerdula rosea*. [Norfolk, Eng.]—**Drying-oven**, an oven used for expelling moisture from various articles. The air-oven is the most generally used of this class. Drying-ovens heated to a point somewhat above the boiling-point of water, which expel water by converting it into steam, are also used for many purposes.—**Dutch oven**, a tin utensil for roasting meat, etc., closed at the sides, back, top, and bottom, and somewhat resembling in shape an open shed. The oven covers the joint or other article to be roasted on all sides except that facing the fire. (Also called *kitchen* or *tin kitchen* in the New England States and elsewhere.) The bake-kettle, a cast-iron vessel with a close-fitting convex cover upon which hot embers or coals are placed when the implement is used, is also sometimes called a *Dutch oven*.—**Egyptian oven**, a large earthen crock sunk in the ground and heated by interior fire, which is removed to permit the baking of lumps of dough. These are thrown with force against the interior, and adhere thereto. The crock is then covered till the baking is finished. This is a very ancient form of oven, largely used in the East even to the present day.—**Elevated oven**, a range-oven situated higher than the fire-pot.—**Heating-oven**, an oven designed and used for simply heating, or for heating pieces of wood or other materials to be joined by glue or cement, or for heating vessels that must be used while hot; a hot-closet.—**Out-oven**, a domed brick oven built by itself, apart from any building. Its construction is almost identical with that

described under *brick oven*, except that it has a chimney extending straight upward over the mouth of the oven.—**Reel oven**, an oven in which the substances to be baked or dried are placed on swinging shelves attached to endless chains running on reels within a heated inclosure. The reels are turned at a velocity that permits the articles to be dried sufficiently, or baked completely, when the chain makes a complete circuit, which brings one of the swinging shelves on a level with the door of the oven. The finished articles are then removed from this shelf, and a new charge is put in their place. This discharging and recharging is successively performed for each shelf. Generally, ovens of this kind and rotary ovens are continuously heated by circulation of heated air through them, or by heated air through their walls, or by highly heated steam-coils.—**Revolving oven**, an oven in which the floor, or the shelves supporting the articles to be baked, etc., revolve horizontally or vertically. The articles are completely dried or baked in a single revolution, and are successively removed and replaced by new charges, as described under *reel oven*, which is an example of this kind of oven. In some ovens of this class a shaft with radial arms carrying swinging shelves rotates vertically in the heated inclosure. The manipulation and heating are as described under *reel oven*.—**Rotary-hearth oven**, an oven in which the floor or hearth revolves.—**Rotary oven**, an oven which can be horizontally rotated as a whole on a central pivot. Such ovens were formerly used with a form of kitchen stove called *rotary stove*. They were portable tin ovens made to fit the tops of the stoves, which were circular, and constructed to rotate on a central pivot. The top of the stove was toothed on the under side of its outer margin. The teeth were engaged by a small pinion operated by a crank. The articles to be baked were placed on the top of the stove and covered with a portable tin oven, and to prevent overheating of any part, the top of the stove was frequently turned to change the position of the parts relatively to the fire-pot.—**Traveling-apron oven**, an oven in which an endless belt traverses horizontally, carrying the articles to be baked from end to end of the oven. (See also *cake-oven*, *porcelain-oven*, *roasting-oven*, and *tile-oven*.)

oven-bird (uv'n-bêrd), *n.* 1. The golden-crowned thrush, *Sturnus auricapillus*, an oscine passerine bird of the family *Mniotiltidae*: so called from the fact that its nest is arched or roofed over like an oven. [Local. U. serving as a prelude or introduction to an extended
work, as an opera or oratorio. Its form
varies from a brief flourish to a medley of melodies or

some cases overtures are divided into two or more sections
or movements, resembling those of a suite or a sym-
phony, each modeled upon some dance form, the sonata
form, the fugue form, etc.; but they are more frequently
in a single continuous movement. Many veritable over-

customary to give the name to detached works for orchestra

such cases a special title is usually given to the composition.

the same must be first proposed as an *overture* to the
Assembly, and, being passed by them as such, be remitted
to the consideration of the several Presbyteries of this
Church, and their opinions and consent reported to the
next General Assembly. . . . If returns . . . show that
a majority of the Presbyteries approve, the *overture* as sent
down may then be passed, and most frequently is passed,
into an Act by the Assembly.

invert is primarily to turn upside down, but it may be

oviduct (ô-vi-duk't), *n.* [*< NL. oviductus*, < *L. ovum*, egg, + *ductus*, a leading, duct: see *duct*.] The excretory duct of the female genital gland, or female gonaduct; a passage for the ovum or egg from the ovary of an animal: chiefly applied to such a structure in an oviparous animal, not differentiated into Fallopian tube, womb, and vagina. An oviduct exists in most vertebrates, and is usually paired, there being one to each ovary, but often single, the duct of one of the other side remaining undeveloped, as in birds. When well formed, as in birds and other animals which lay large eggs to be hatched outside the body, the oviduct is a musculo-membranous tube or canal, of which one end is in relation with or applied to the ovary, and the other debouches in the cloaca, the tube being held in place by a special mesentery or mesometrium. In the course of the oviduct the membrane acquires special characteristics, and secretes different substances: so that the ovum, escaping from the ovary as a ball of yellow yolk, becomes successively coated with white albumen, with a soft egg-pod, and finally, as in birds, with a hard chalky shell. The oviducts of the lowest mammals, which are oviparous, are of similar character; but in most mammals the pair of oviducts coalesce in the greater part of their length, whence result a single vagina and womb, with a pair of Fallopian tubes or oviducts in a restricted sense. A womb or uterus is simply a specialized part of an oviduct, where the ovum is detained long enough to be developed into a fetus and born alive. The oviducts of invertebrates, where any exist, are as diverse in character as the ovaries. See *ovary*, and cuts under *Dendrocoela*, *Dibranchiata*, *Epizoa*, and *germarium*.

ovoviviparous (ô'vô-vi-vi-pâ-rus), *a.* [*< NL. ovoviviparus*, *< L. ovum*, egg, + *LL. viviparus*, bringing forth alive: see *viviparus*.] Producing eggs which are hatched within the body of the parent but without placental attachment, so that the young are born alive, yet have not been developed in that direct connection with the blood-vessels of the mother which is characteristic of viviparous animals.

Ovoviviparous animals are intermediate in this respect between oviparous and viviparous ones, whence the name. The process is a kind of internal incubation, but not a true gestation or pregnancy. It occurs in some fishes, many reptiles, some insects, as flesh-flies, various worms, and a great many other invertebrates. The carrying of eggs in any special receptacle about the body, from the time they leave the ovary until they hatch, also constitutes ovoviviparity. The implantational mammals, as marsupials, whose young are born very imperfect and then placed in a pouch, are sometimes called ovoviviparous.

ovule (ô'vûl), *n.* [*< F. ovule*, *< ML. ovulum*, a little egg (*NL.* an ovule), dim. of *L. ovum*, egg: see *ovum*.] **1.** A little egg; specifically, in *anat.*, *physiol.*, and *zool.*, an ovulum or ovum, especially a small one, as that of a mammal, or one not yet matured and discharged from the ovary: specifically applied by Haeckel to the ovum or fertilizable but unfertilized egg-cell of the female, conformable with the use of *spermule* for the male sperm-cell. Its protoplasm is termed by him *ovoplasm*, and its nucleus *ovococcus*.—**2.** In *bot.*, a young or rudimentary seed; a peculiar outgrowth or production of the carpel which, upon fertilization and the formation of an embryo within, becomes the seed. In the angiospermous gynoecium the ovules are normally produced along the margins, or some part of the margins, of the carpellary leaf, either immediately or by the intermediation of a placenta, which is a more or less evident development of the leaf-margins for the support of the ovules. Rarely ovules are developed from the whole internal surface of the ovary, or from various parts of it, in no definite order, directly from the walls, and without the intervention of anything which can be regarded as a placenta. In gymnosperms the ovules are borne on the face of the carpellary scale or at its base; or on metamorphosed leaf-margins, as in *Cycas*; or when there is no representative of the carpel on the cauline axis, seemingly as a direct growth of it. (*Gray*.) The only essential part of the ovule is its *nucleus*, or *micellus*, as it has been termed recently, which is usually invested by one or two coats, the *primine* and *secundine*. The coats are sacs with a narrow orifice called the *foramen*, the closed vestige of which becomes the *micropyle* in the seed. The proper base of the ovule is the *chalazæ*, and it may be either sessile or on a stalk (*funiculus*) of its own. The *hilum* is the scar left when the seed is detached from its funiculus. As to shape, ovules may be orthotropous, campylotropous, amphitropous, or anatropous; and as to position in the ovary, they may be erect, ascending, horizontal, pendulous, or suspended. In regard to numbers, they may be solitary, few, or indefinitely numerous. See cuts under *acumbent*, *anatropous*, *funicle*, *magnolia*, *orthotropous*, and *ovary*.

Egg-shell (*Ovulum ovum*).

ovum (ô'vum), *n.; pl. ova* (ô'vâ). [L., = Gr. *ôvov*, an egg: see *egg*.] 1. An egg, in a broad biological sense; the proper product of an ovary; the female germ or seed, which when fertilized by the male sperm, and sometimes without such fecundation, is capable of developing into an individual like the parent. There is a great similarity in the ova of different animals throughout the metazoic series, from the sponge to the human being, no ova in their early stages being distinguishable from one another in their essential characters. All true ova, as distinguished from spores and products of fission or gemmation, are referable to the single morphological type of the cell; and they are furthermore indistinguishable from unicellular animals, and from many of the cells composing the bodies of the higher animals. An ovum consists of a quantity of protoplasm or cell-substance called the *vitellus* or *yolk*, inclosed in a cell-wall or vitelline membrane, and provided with a nucleus and usually a nucleolus; it is engendered in the ovary, usually in an ovicel or so-called Graafian follicle, is discharged from its matrix, usually then meeting with a nutritive element, and proceeds to develop within or without the body of the parent. The ovum proper, like most cells, is usually of microscopic size; but its bulk may be enormously increased by the addition of extrinsic or adventitious protoplasmic or albuminous substance, and it may be further protected by various kinds of egg-pod or egg-shell, all without losing its essential character as a cell. The largest ova, relatively and absolutely, are birds' eggs, these being by far the largest cells known in the animal kingdom. Here the quantity of food-yolk which does not undergo transformation into the body of the chick is out of all proportion to the formative yolk proper, which makes only a speck in the great ball of "yellow" and "white." Such ova are called *meroblastic*, in distinction from *holoblastic*, the human ovum is very minute, relatively and absolutely, averaging about $\frac{1}{16}$ of an inch in diameter. It is said to have been first recognized by K. E. von Baer in 1827. The parts of the ovum have been badly named, without reference to its morphology as a cell. Thus, the cell-wall is called the *zona pellucida*; the nucleus is named the *germinal vesicle* or *vesicle of Purkinje*, and its nucleolus the *germinal spot* or *spot of Wagner*. The phrases *germinal vesicle* and *germinal spot* are misleading. The first stages of development of an ovum, consequent upon fertilization, consist in the segmentation of the *vitellus*, or yolk-mass, by which the cell-substance becomes a mulberry-mass of spherules, called the *morula*. When there are two layers, inner and outer blastodermic layers, they are distinguished as *endoderm* and *ectoderm*; when a third intermediate layer is formed, it is the *mesoderm*. An ovum is called, in general, a *germ* until the rudiments of its specific characters appear, when it becomes an *embryo*, and later may be a *fetus*. That department of ontology which treats of the development of the ovum is *embryology*. See

A rapacious nocturnal bird of prey of the family *Strigida*. *Owls* constitute a highly monomorphic group, the suborder *Strigæ* of the order *Raptores*. With few exceptions, they are of distinctively nocturnal habits and a peculiar physiognomy produced by the great size and breadth of the head and the shortened face with large eyes looking forward and usually set in a facial rictus or sink of modified feathers, which hide the base of the bill. Many owls have also "horns" (that is, ear-tuffs) or plumicorns. The bill is hooked, but never toothed, and the nostrils open at the edge of the cere, not in it. The plumage is very soft and blended, without after-shafts, and the flight is noiseless. The talons are large, sharp, and hooked as in other birds of prey; the outer toe is versatile, and the feet are usually feathered to the claws. (See cut under *bracate*.) There are many varieties of owl characters. (See *Strigæ*.) *Owls* are among the most nearly cosmopolitan of birds. They feed entirely upon animal substances, and capture their prey alive, as small quadrupeds and birds, various reptiles, fishes, and insects. They lay

from three to six white eggs of subspherical shape. There are about 200 species, assigned to some 50 modern genera, and now usually considered as constituting 2 families, *Alucoidae* and *Strigidae*, or barn-owls and other owls. See cuts under *barn-owl*, *Bubo*, *Glaucoedon*, *haruk-owl*, *Nyctala*, *Otus*, *snov-owl*, and *Strix*.

2. A variety of the domestic pigeon: so called from its owl-like physiognomy. The head is round, and the beak very short. There are several strains of owls, known as English, African, and Chinese. All run in various colors.

The *owls* are African, English, and Chinese. The African is at home in Tunis, whence many thousands have been sent to England, and of which scarcely dozens remain. The bird is the smallest of the family, and so delicate that its term of life out of African air is very limited. The English owl is fair in size, with eye round and prominent, the dewlap well developed, and the frill extending to the lower point of the breast. In the Chinese this frill-feathering is excessive, even extending up about the throat to the eyes.

The Century, XXXII. 107.

in the natural state as a *bull*, whose female is a *cow*, and whose young is a *calf*; in a wider sense, an animal of the family *Bovina* and subfamily *Bovinae* or *Ovibovinae*; a bovine. The several animals of this kind have under their specific designations, as *buffalo*, *bison*, *aurochs*, *zebu*, *miak-ox*, etc.: the word is commonly restricted to the varieties of *Bos taurus*, the common ox, which is one of the most valuable of domestic animals. Its flesh is the principal article of animal food, and there is scarcely any part of the animal that is not useful to mankind: the skin, the horns, the bones, the blood, the hair, and the refuse of all these, have their separate uses. Having been specially domesticated by man from a stock which it is probably impossible to trace, the result has been the formation of very many breeds, races, or permanent varieties, some of which are valued for their flesh and hides, some for the richness and abundance of their milk, and others in great repute for both beef and milk. Among the first class may be mentioned the Durham or shorthorn, the polled Aberdeen or Angus, and the West Highland or kylie. Among the most celebrated for dairy purposes are the Jersey, Guernsey, Holstein-Friesian, Ayrshire, and Suffolk dun. For the purposes both of the dairy-farmer and of the grazier, the Hereford and a cross between a shorthorn and an Ayrshire are much fancied. The ox is used in many parts of the world as a beast of draft. The "wild ox," now surviving in only a few parks, as at Chillingham Park in Northumberland, and at Cadzow Forest in Lanarkshire, seems, whatever its origin, to have been formerly an inhabitant of many forest-districts in Great Britain, particularly in the north of England and the south of Scotland.

2. In a restricted sense, the castrated male of *Bos taurus*, at least 4 years old and full-grown or nearly so. (See *steer*.) Such animals are most used as draft-animals and for beef.—*Galla ox*, the sangra, a kind of ox found in the Galla country. *Thwaited ox*, or *Irish ox*, see *Irish* bull.—*To have the black ox tread on one's foot*, to know what sorrow or adversity is.

chem., a compound of oxygen with another element. The oxids are grouped as acid-forming, basic, or neutral. The acid-forming oxids, also called *acid anhydrides*, are compounds of oxygen with negative or acid radicals. Most of them unite directly with water to form acids, as sulphuric acid, H₂SO₄, which unites with water to form sulphuric acid, H₂SO₄. The basic oxids are compounds of oxygen with positive elements. Many of them form hydroxides, all of which neutralize acids, forming salts, as barium oxide, BaO, which forms the hydrate Ba(OH)₂. The neutral oxids or peroxids usually contain more oxygen than the others, and have only very feeble acid or basic properties. Certain oxids cannot be classed with any of these groups, having both acid and basic properties.

An element discovered by Priestley in 1774, who called it *dephlogisticated air*. It was finally called *oxygen* by Lavoisier, because supposed to be present in all acids. Further investigation, however, has proved that this is not the case. Oxygen is a chemical element existing as a permanent gas, colorless, odorless, and tasteless, and somewhat heavier than atmospheric air. It is soluble in water, which at a temperature of 60° F. dissolves $\frac{1}{10}$ of its volume of oxygen. It combines with most of the elements of the elements, and forms oxids with all of them excepting fluorin. The act of combination is so energetic in many cases as to evolve light and heat, the phenomena of combustion. In other cases, as in the tarnishing or rusting of metals and the decay of animal or vegetable substances, oxidation takes place so slowly that, while the result is the same, the heat evolved at one time is not enough to produce luminous effects or even to be sensible. Free or uncombined oxygen is essential to all animal and vegetable life. Animal heat and muscular energy are results of a slow combustion produced in all parts of the system by oxygen carried in the blood from the lungs. In sunlight oxygen is exhaled by growing plants, but a certain quantity is assimilated as essential to life. Oxygen is the most widely distributed and abundant element in nature; it constitutes about one fifth of the total volume of the atmosphere, which is a mechanical mixture of oxygen and nitrogen. Water contains about 89 per cent. of it by weight, and it is found in most animal and vegetable products, acids, oxides, and salts. The rocks which make up most of the earth's crust contain between 40 and 50 per cent. of oxygen. Under certain conditions oxygen may be made to pass into an allotropic or condensed form called *ozone*.

It was Lavoisier who gave to this curious kind of air or gas the name of *Oxygen*, by which it is now universally known; and it was he, too, who first showed, by the most conclusive experiments, what was really the composition of atmospheric air. His determination of the constitution of the air was made in the year 1777. *Huxley*, *Physiography*, p. 78.

A Fossil Oyster, *Ostrea longirostris*.

Ostreidae, such as *Ostrea edulis*, the common species of Europe, and *O. virginica*, that of the Atlantic coast of the United States. The species are very numerous, and are found in all temperate and tropical countries, in salt and brackish water: there are also many fossil species. The shell is very irregular, both inequivalve and inequilateral, with one valve flattened and the other more concavo-convex, both rough outside and nacreous inside. Each valve has one purplish eye or spot, showing where the single adductor muscle is attached, oysters being thus monomyous; the gills are small, button-shaped body in the flesh is this ligament. The soft greenish substance corresponds to a liver. The fluted layers around a part of the body are the gills or breathing-organs. Oysters have sex, and are very prolific. They spawn in north temperate countries in May and June, during which period and for some time afterward they are not so good for food; whence the common saying that oysters are not good in those months which have no *r* in their names. The spawn or fry is called *spat* or *spet*. Oysters are now very extensively cultivated, the resulting stock being superior to the natural oyster. Starfishes and some carnivorous gastropods (see *borer*) are among the great obstacles to success with which oyster-culture has to contend. Oysters feed upon a great many different aquatic organisms of minute size. In confinement they eat greedily. See cuts under *ciborium*, *integropalliate*, and *Ostrea*.

Bench oyster, an oyster sold at a lunch-counter as a fancy or extra grade.—**Blue Point oyster**, originally, an oyster obtained off Blue Point, near Great South Bay, Long Island; now, any oyster from the south shore of Long Island, whether native or transplanted. They are commonly called *Blue Points*, and the name is popularly but wrongly supposed to refer to the large dark-bluish "eyes" on the inside of the shells. These oysters, but very dried out, are small and well-flavored. **Box oyster**, an oyster from seven to ten years old, of handsome round shape, not less than three inches wide and five inches long. It is the second grade in the New York market, inferior to Saddlecock, and superior to cullings and bushel oysters. The name is due to the fact that they used to be shipped in boxes instead of barrels. (Common to New York City.)—**Bushel oysters**, oysters of inferior quality, sold by the bushel. They form the fourth grade in the New York market, rated below Saddlecock, box, and cullings.—**California oyster**, *Ostrea lurida* of the Pacific coast of North America.—**Canadian oyster**, a northern oyster which has been distinguished by the name *Ostrea canadensis*.—**Gape oyster**, an oyster obtained from Cape Cod or Cape Cod oyster, a kind of northern native or hard oyster. They have many fanciful local names.—**Reef-oyster**, an oyster growing naturally on a reef, as a result to *Cras*.—**Saddlecock oyster**, the first or largest grade of oysters in the New York market. The oysters that first bore that name were taken from a rock so called in Little Neck Bay, Long Island, the supply from which was soon exhausted.—**Sand-oysters**, oysters which have been scattered and exposed or damaged on sand-shoals; sand oysters.—**Shrewsbury oysters**, oysters from Shrewsbury river, New Jersey.—**Single oyster**, an oyster which becomes detached from the bunches after two years' growth; hence, a grown or merchantable oyster.—**Soft oyster**, the oyster obtained from the Chesapeake and southward; distinguished from the *hard* or native northern oyster.—**Thorny oysters**, bivalves of the genus *Spondylus*.—**Tonged oysters**, oysters taken with the tongs; they are preferred to those which are dredged.—**Vegetable oyster**. When properly exposed, the degree of discoloration indicates the relative amount of ozone in the air. Ozone-papers are usually either red litmus-paper dipped in a dilute solution of potassium iodide, or paper saturated with a mixture of potassium iodide and starch. In the litmus-paper the ozone decomposes the potassium iodide and combines with the potassium, forming potash, by which the red litmus is rendered blue. In the iodized starch-papers, the ozone combines with the potassium, and the free iodine combines with the starch, forming a blue iodide of starch.

ozonoscopic (ô-zô-nô-skop'ik), *a.* [< *ozonoscope* + *-ic*.] Indicating the presence of ozone.

1. The sixteenth letter and twelfth consonant of the English alphabet, having a corresponding position in other alphabets. The scheme of parallel forms, as given in the case of the other letters (see especially A), is as follows:

ⲡ ⲛ ⲟ ⲛ ⲛ

Egyptian. Hieroglyphic. Phenician. Greek and Latin.

The usual Greek Π was made by extending the originally short second perpendicular limb; the Latin (whence our *P*), by curving the same round to meet the perpendicular (*p*); by curving the same round to meet the perpendicular (corresponding to *b* as sonant, and *m* as nasal), made with closure of the lips, during the maintenance of which closure there is complete silence, the character being brought to light by explosion upon the following sound. The *p*-sound is in English much less common (below a third) than the *t*-sound, and slightly less common (about four fifths) than the *k*-sound. The character *p* has no varieties or irregularities of pronunciation in English save as it is silent at the beginning of a few Greek words, as *psalm*, *pneumatic*, *pteropod*, and, much more rarely, elsewhere, as in *receipt*, *account*. It enters into one important digraph, namely *ph*, found in numerous words of classical origin, and pronounced as *f* (but originally as written, or as an aspirated *p*, a *p* with an audible *h* after it, as in our compound *uphill*). (See *ph*.) According to the general law of correspondence, a *p* in the Germanic part of our language should represent an original *b*; but *p* appears to have been almost altogether wanting in the primitive language of our family; and hence our *p*, when not of classical origin, or borrowed from elsewhere, is the result of some irregular process.

2. As a medieval numeral, 400; with a dash over it (P), 400,000.—3. As a symbol: (a) In chem., the symbol for phosphorus. (b) In math., the Greek capital Π denotes a continued product.

Thus, $\prod_p (1 + p)$, for which $\Pi (1 + m)$ is also written, denotes the product $(1 + m) m (m - 1) \dots 3.2.1$. The small Greek letter π denotes the ratio of the circumference to the diameter, or $3.14159265359 \dots$. This notation was introduced by Euler. The other form of the Greek minuscule, μ , denotes in astronomy the longitude of the perihelion.

2. A lineal measure of variable extent, representing the space naturally measured by the movement of the foot in walking. In some cases the name is given to the distance from the place where either foot is taken up, in walking, to that where the same foot is set down, being assumed by some to be 3 feet, by others 4½ feet—this pace of a double step being called a *geometrical pace*, or *great pace*. The pace of a single step (the military pace) is estimated at 2½ feet. The Welsh pace is 2½ English feet. According to the position of the long in the first, second, third, or fourth place respectively, the foot assumes four forms, distinguished as *first pæon* (— — — —), *second pæon* (— — — —), *third pæon* (— — — —), and *fourth pæon* (— — — —). The pæon has a magnitude of five moræ or primary times (k. e., is pentasemic), its resolved form being the pentabach (— — — —). Three of these times belong to the thesis and two to the arsis, or vice versa (— — — —), or (— — — —), or (— — — —), so that the pæon belongs to the type of the hemiolic or pæonic class of feet. Only the first pæon and the fourth pæon were in use in pæonic verse, the contracted form, known as the *cretic*, being, however, more common; the second and third occurred in verses analyzed by the ancients as mixed Ionic, or epiconic. The *cretic* (— — — —) was sometimes known as the *pæon diagiotis*, as distinguished from the *pæon epibatus* (— — — —), in which each short of the pentabach was doubled (k. e., represented by a long). The pæon received its name from its original use in compositions in honor of Apollo (see *pæan*). See *diagiotis*, *epibatus*. Also spelled, less correctly, *pæon*.

In the first pæon, an equivalent of the *cretic*, an arsis consisting of a long and short is followed by a thesis consisting of two shorts. *J. Hadley*, *Essays*, p. 98.

Agenbille of Trwy (E. E. T. S.), p. 235.
The Christian Church fixed itself first in the seats and centres of civilization, in the towns and cities of the Roman Empire, and in them its first triumphs were won; while long after these had accepted the truth, heathen superstitions and idolatries lingered on in the obscure hamlets and villages of the country; so that *pagans* or villagers came to be applied to all the remaining votaries of the old and decaying superstitions, inasmuch as far the greater number of them were of this class. The first document in which the word appears in this its secondary sense is an edict of the Emperor Valentinian, of date A. D. 368. The word "heathen" acquired its meaning from exactly the same fact, namely, that at the introduction of Christianity into Germany the wild dwellers on the "heaths" longest resisted the truth.

Palaeornis (pā'lē-ōr'nis), *n.* [NL., < Gr. *palaios*, ancient, + *ornis*, a bird.] The typical genus of *Palaeornithinæ*, founded by Vigors in 1825: so called because some bird of this kind was known to the ancients of Greece and Rome. One species was named by Linnaeus *P. alexandri*, on the supposition that it was that mentioned by Onesicritus, a historian of Alexander the Great. These birds are known as *ring-parrots*, from the characteristic collar around the neck. *P. torquatus* is the common ring-parrot of India, in parts of which country abounds, sometimes in flocks of thousands. This appears to be the bird often figured as an attribute or accessory of some of the Hindu goddesses in sculpture and painting, like the owl of Minerva or the dove of Venus. *Palaeornis* is the largest as well as the name-giving genus of its group, with upward of 20 species, inhabiting chiefly the Oriental regions, but also Africa. The general color is green, the bill wax-yellow in the male, the lores feathered, the tail long and cuneate, the wings pointed, and the form rather lithe. The voice is very loud and harsh, but the birds may be taught to talk a little, and prove tractable in confinement. See cut under *ring-parrot*.

In 1777 the two were reunited; in consequence of the treaties of Lunéville (1801) and of Paris (1814-15), Bavaria retained the Upper Palatinate and a portion of the Lower Palatinate west of the Rhine, while the remainder of the Lower Palatinate was divided among Baden, Hesse, Prussia, etc. The Bavarian portions now form the governmental districts of Palatinate and Upper Palatinate.

The Paleozoic series may, from a paleontological point of view, be properly separated into two great divisions, a newer and an older. The former comprises the Silurian; the latter, the Devonian, Carboniferous, and Permian. The older Paleozoic is distinguished by the great predominance of graptolites, trilobites, and brachiopods, and by the absence of vertebrates; the newer Paleozoic, by the number and variety of the fishes and amphibia, by the disappearance of graptolites and trilobites, and by an extraordinarily developed form, the large corals. In character, from which a very considerable part of the coal of the globe has been formed. Rocks of Paleozoic age are spread over wide areas. They are especially important in the eastern and northeastern United States and in the Upper Mississippi valley, in which regions they usually form the surface-rock, being covered only with detrital formations of the most recent age. Almost the whole of the bed-rock in New York and Pennsylvania is of Paleozoic age, and here the various groups of this series were studied out by the Geological Surveys of those States from 1834 on. To the labors of Sedgwick and Murchison in Wales and western England, carried on at about the same time with the beginnings of the New York and Pennsylvania Surveys, is due the larger share of the credit of disentangling the complicated structure of a region where the Paleozoic rocks are extensively developed, and it is there that the materials were obtained for the establishment by Murchison of the Silurian and Devonian systems, which, with the Carboniferous and Permian, form the Paleozoic epoch.

of the Colosseum, baths, triumphal arches, and other secular buildings of the Romans. It has been applied more frequently to palaces and civic buildings than to churches. 3. Chemical symbol, Pd; atomic weight, 106.5. One of the rare metals associated with platinum. It was separated from native platinum by Wollaston in 1803, and named after the planet *Pallas*, which had just before that time been discovered by Olbers. *Palladium* is dimorphous. It occurs in Brazil native, in minute octahedral crystals; and on the Harz it has been found in small hexagonal plates. It is, however, a decidedly rare substance, and the chief supply comes from the working over of the platinumiferous residues of various mines. It resembles platinum in appearance, but is harder; its specific gravity is 11.4. It fuses more readily than platinum or any other of the so-called platinum metals, melting, as is stated by some authorities, about as easily as wrought-iron. It is both ductile and malleable, and would be a very useful metal if it were not so scarce as to be expensive and irregularly attainable. The graduated surfaces of some astronomical instruments have been made of palladium, a use for which this metal is admirably adapted on account of its color and its unalterability in the air. Alloyed with silver, it has been employed by dentists as a substitute for gold.—*Palladium-gold*. See *porpale*.

One of the planetoids revolving between the orbits of Mars and Jupiter: discovered (the second in the order of time) by Olbers, at Bremen, in 1802. On account of its minuteness, and the nebulous appearance by which it is surrounded, no certain conclusion can be arrived at respecting its magnitude. Its diameter has been estimated at 172 miles, and its period of revolution is 4.61 years. Its light undergoes considerable variation, and its motion in its orbit is greatly disturbed by the powerful attraction of Jupiter.

They both refer to the effort to make an offense seem less by bringing forward considerations tending to excuse; they never mean the effort to exonerate or exculpate completely. They have had earlier differences of meaning, and *palliate* has a peculiar meaning of its own (see def. 3); *palliate* also would be likely to be used of the more serious offense; but otherwise the words are now essentially the same.

pallium (pal'i-um), *n.*; *pl. pallia* (-ā). [= *F. pallium*, *OF. pallon*, *palluom* = *Sp. pallio* = *Fg. It. pallio*, < *L. pallium*, a coverlet, mantle, cloak; cf. *palla*, a mantle, cloak: see *pall*¹.] 1. In *Rom. antiqu.*, a voluminous rectangular mantle for men, corresponding to the Greek himation (see *himation*), and considered at Rome, because worn by Greek savants, as the particular dress of philosophers; also, a toga or other outer garment; a curtain, etc., of rectangular shape.—2. *Eccles.*: (a) In the early church, a large mantle worn by Christian philosophers, ascetics, and monks. (b) A vestment worn by certain bishops, especially patriarchs and metropolitans.

It seems to have come first into use in the Eastern Church, where it is known as the *omophorion*, and to have been worn by patriarchs, and given by them to metropolitans. Some authorities think that it was of primitive origin and at first worn by all bishops, while others hold that it was originally an imperial garment, bestowed by the emperor as a mark of distinction upon patriarchs and others, and afterward given to metropolitans and bishops.

It has always been of wool. It seems at first to have been a mantle rolled together and passed round the neck so as to fall both in front and at the back. It then became contracted in width and was worn nearly as it still is in the Greek Church, as a wide woollen band fastened round the shoulders and descending nearly to the feet. In the Latin or Roman Catholic Church it gradually assumed a different shape, and is now a narrow band like a rine, passing round the shoulders, with two short vertical pieces, falling respectively down the breast and the back. It is ornamented with crosses, and has three golden pins by which it is attached with loops to the chasuble. The *pallium* was worn anciently in the Western Church by the Pope and by Gallican metropolitans. From the sixth cen-

tury it began to be given by the Pope to some metropolitans outside of his own diocese, in sign of special favor or distinction—at first, according to some authorities, only with approval of the emperor. By the seventh or eighth century it came to be regarded as a sign of acknowledgment of papal supremacy. At present, in the Roman Catholic Church, a bishop elected or translated to a see of metropolitan or higher rank must beg the Pope for the *pallium*, and receives it after taking an oath of allegiance to the Pope. The Pope wears it whenever he officiates, bishops only on certain great feasts. Anglican archbishops no longer wear the *pallium* since the Reformation, but it forms part of the heraldic insignia of the archbishops of Canterbury, Armagh, and Dublin. Also called *pall*. (c) An altar-cloth; a frontal or *pall*.—3. In *conch.*, the mantle, mantle-flap, or mantle-skirt of a mollusk, an outgrowth of the dorsal body-wall.

It is a specialized, more or less highly and very variously developed integument, including epithelial, vascular, glandular, and muscular structures, and forming folds or processes which represent the foot and other parts. It is often wanting. See cuts under *Lamelibranchiata*, *Pulmonata*, and *Tridacnidae*.

4. In *ornith.*, the mantle; the stragulum; the back and folded wings together, in any way distinguished, as by color in a gull, etc.—5. A cirro-stratus cloud when it forms a uniform sheet over the whole sky.

M. Poëy has proposed the name of *Pallium*, but this term has not met with general acceptance.

Scott, Meteorology, p. 128.

pall-mall (pel-mel'), *n.* [Formerly also *pale-malle*, *pallmail*, *pallmaille*, *paillemail*; also, in more recent spelling, *pell-mell*; < *OF. pal-mail*, *palmaile*, *pallmaille*, *palemaille*, *paillemail*, *pailemail*, etc., = *Sp. palmaillo* = *Pg. palamatha*, < *It. palamaglio*, *pallamaglio*, the game of pall-mall, lit. 'ball-mallet'; < *palla*, ball (< *ML. palla*, ball, < *OHG. palla*, *MHG. G. ball*: see *ball*), + *maglio*, < *L. malleus*, a mallet; see *mallet*.] 1. A game, formerly played, in which a ball of boxwood was struck with a mallet or club, the object being to drive it through a raised ring of iron at the end of an alley. The player who accomplished this with fewest strokes, or within a number agreed on, was the winner.

To St. James's Park, where I saw the Duke of York playing *pellemale*, the first time that ever I saw the sport. *Peppys, Diary*, April 2, 1661.

The game might develop into golf or *pell mell*. . . If the point played to was a hole in the ground, golf arose; if you played to a stone, tree, or rock, or through an iron hoop elevated on a post, *pell mell*, *jeu de mail*, *Pila malleus* was the result. . . Lathier describes the attitude and "swing" at *pell mell* in words that apply equally well to golf. . . Generally speaking, the aim was to "loft" the ball, in fewer strokes than your adversary took, through an elevated iron ring.

A. Lang, Golf (Badminton Library), pp. 4, 11.

2. The mallet used in this game.

If one had *paille-malle* it were good to play in this alley, for it is of a reasonable good length, straight, and even. *Fr. Garden for Engl. Lad.* (1621). (Nares.)

3. A place where the game was played. The game was formerly practised in St. James's Park, London, and gave its name to the famous street called *Pall Mall* (locally pronounced *pel-mel*).

In the pavilion of y^e new Castle are many faire rooms, well paynted, and leading into a very noble garden and parke, where is a *pall-mall*, in y^e midst of which, on one of the sides, is a chapel. *Evelyn, Diary*, Feb. 27, 1644.

Hence ult. *palm*².] 1. The flat of the hand; that part of the hand which extends from the wrist to the bases of the thumb and fingers on the side opposite the knuckles; more generally and technically, the palmar surface of the manus of any animal, as the sole of the fore foot of a clawed quadruped, as the cat or

mouse, corresponding to the planta of the pes or foot. In man the palm is fleshy, and presents two special eminences, the *thenar* (ball of the thumb) and, opposite to it, the *hypothener*, mainly due to the bulk of the subjacent muscles. The habitual tendency of the fingers in grasping and holding throws the skin into numerous creases, several principal ones being quite constant in position. The character of these creases, in all their detail and variation in different individuals, is the chief basis of *chirognomy* or *palmistry*. See phrases under *line*².

palm² (pām), *n.* [*< ME. palme*, < *AS. palm* = *OS. palma* = *D. palm* = *MLG. palme* = *OHG. palma*, *MHG. G. palme* = *Isl. pálmr* = *Sw. palm* = *Dan. palme* = *F. palme* = *Sp. Pg. It. palma*, < *L. palma*, a palm-tree, palm-branch, the topmost branch, any branch, a palm-branch as a symbol of victory, also the fruit of the palm, a date, also the name of several other plants; so called from the resemblance of the

leaves of the palm-tree to the outspread hand; < *palmæ*, the palm of the hand: see *palm*¹. The Gr. name of the date-palm was *φωινίς*: see *phoenix*.] 1. A tree or shrub of the order *Palmae*. The palms form a natural plant-group of great interest in appearance highly picturesque and often elegant, and in usefulness surpassed by no family except the grasses. The pulpy fruit of some species, most notably of the date, and the seed-kernel of others, preëminently the cocoanut, are edible. Oil is yielded by the fruit-pulp of some (oil-palm) and by the seeds of others (cocoanut, baccana, etc.). The pith of the sago-palms is farinaceous; and the large terminal bud of the cabbage-palm serves as a vegetable, as do the young seedlings of the palmyra. The sap of the wild date-tree and other species yields palm-sugar or jaggery; that of the coquito, palm-honey. The juice of various species becomes toddy or palm-wine, which in fermenting serves as yeast, and distilled affords an spirituous liquor. Aside from food and drink, the betel-nut, a kind of catechu, and a kind of dragon's-blood are palm-products; a candle-wax exudes from *Ceroxylon*; vegetable ivory is the nut of the ivory-palm. Palm-wood is useful for building (date-palm, palmyra, etc.), for fine work (porcupine-wood), for piles (palmetto), and for flexible articles (rattan). The leaves of many species serve for thatching (bissu-palm, royal palmetto, palmyra, etc.), for making hats, baskets, and fans, and in place of paper (palmetto, talipot, etc.). The leafstalks of some (kittul, pissava) furnish an important fiber, as also does the husk of the cocoanut. There are many other uses. The cocoanut, and palmyra-palms lead in importance. The palm of the Bible is the date-palm. (For symbolic use, see def. 2.) As ornamental plants, palms, especially the kind are indispensable where sufficient hothouse room can be had.

The *palmæ* eke now me setteth forth to stande.

Palladius, *Husbonaria* (E. E. T. S.), p. 152.

Breadths of tropic shade and palms in cluster, knots of Paradise.

Tennyson, *Locksley Hall*.

2. A branch, properly a leaf, of the palm-tree, anciently borne or worn as a symbol of victory or triumph; hence, superiority; victory; triumph; honor; prize. The palm was adopted as an emblem of victory, it is said, because the tree is so elastic as, when pressed, to rise and recover its correct position. The Jews carried palm-branches on festival occasions, and the Roman Catholic and Greek churches have preserved the custom in celebrating the entry of Christ into Jerusalem. See *Palm Sunday*. See also def. 3.

And come to the place where ye anngell of our Lord brought a *palm* unto our blessed Lady, shewing unto her ye days of her deth. *Sir R. Guylford*, *Fylgymage*, p. 32.

3. One of several other plants, popularly so called as resembling in some way the palm, or, especially, as substituted for it in church usage. Among plants so designated are, in Great Britain, chiefly the great willow or goat-willow, *Salix Caprea*, at the time when its catkins are out, and the common yew (the latter is universally so called in Ireland); in Europe also the holly, box, and another willow; and in the northern United States the hemlock-spruce.

About 1,100 species are known, classed in 129 genera, 7 tribes, and 18 subtribes. They are mainly tropical, especially American, and are most abundant on coasts and islands; fewer in Asia and Australia; fewest in Africa; reaching lat. 44° N. in Europe, 36° in America, 34° in Asia. Palmella (pal-mel'ā), *n.* [*NL. (Lyngbye, 1819)*, a dim. form, having reference to the jelly-like appearance; < Gr. *παλμος*, vibration, < *πάλ्लειν*, shake, vibrate.] A genus of fresh-water algae, typical of the *Palmellaceae*, having globose or oblong cells, with chlorophyll usually green, but sometimes changing to orange or reddish color. The cells are surrounded with a thick integument, which is generally soon confluent into a shapeless mass of jelly; multiplication is mostly by division. The forms included in this genus are probably not autonomous, but represent arrested polymorphic forms which multiply rapidly by the process of cell-multiplication, without developing, for a protracted period, the true plants. The particular plants, however, to which they belong have never been determined.—**Palmella stage**, or **palmella condition**, a general phrase sometimes applied to certain of the lower algae which exhibit the peculiar gelatinous masses described above. In the *Schizomyces* this condition or stage has lately been called the *zoogloea stage*. See *Zoogloea*.

A pilgrim who had returned from the Holy Land, had fulfilled his vow, and had brought with him a palm-branch to be deposited on the altar of his parish church; hence, an itinerant monk who went from shrine to shrine, under a perpetual vow of poverty and celibacy. The distinction between *pilgrim* and *palmer* seems never to have been closely observed.

palmerin (pal'mēr-in), *n.* [*< Palmerin* (see *def.*).] One of a line of romantic heroes of the age of chivalry, who took their names or their titles from Palmerin de Oliva, an illegitimate grandson of a Greek emperor of Constantinople. This Palmerin derived his name from the circumstance of his exposure in a wicker basket on a mountain-side among olive-trees in Spain. He afterward became famous for his exploits in Germany, England, and the Orient. The exploits of the Palmerius, as celebrated in the famous Spanish romances called by their name, are evidently modeled after those of Amadis of Gaul. In literature the name is often applied as a term of distinction to any redoubtable champion of the age of chivalry.

That brave Rosicler
That damned brood of ugly giants slew,
And *Palmeria* France's overthrow;
Beau, and *Fr.*, Knight of Burning Pestle, iii. 2.

The oldest ballads tell us nothing at all . . . of the *Palmerins*, nor of many other well-known and famous heroes of the shadow-land of chivalry.

Tieckman, Span. Lit., I. 119.

palmer-worm (pā'mēr-wēr-m), *n.* [*< palmer*² + *worm*.] 1. A caterpillar; especially, a hairy caterpillar injurious to vegetation, but what kind is unknown or undetermined. The name occurs three times in the Bible (Joel i. 4; ii. 25; Amos iv. 9) as the translation of the Hebrew *qazim*, rendered in the Septuagint *κέρμας* and in the Vulgate *eruca*. Some have supposed it to be a destructive kind of locust, as *Pachytia nigratorius*; but in Joel the name is expressly distinguished from "locust." The Hebrew name is referred to a root meaning "to cut off"; the Greek *κέρμας* refers to the bending or looping of some caterpillars, apparently pointing to a looper or measuring-worm—that is, the larva of some geometrid moth; and the Latin *eruca* may have the same significance. The destructiveness of many of these geometrids would fully bear out the Biblical implication. See *oubt*.

There is another sort of these Caterpillars, who have no certain place of abode, nor yet cannot tell where to find their food, but, like unto superstitious Pilgrims, do wander and stray hither and thither, (and like Mice) consume and eat up that which is none of their own; and these have purchased a very apt name amongst us Englishmen, to be called *Palmer-worms*, by reason of their wandering and roghish life (for they never stay in one place, but are ever wandering, although by reason of their roughness and ruggedness some call them *Beare-worms*. They can by no means be destroyed, and to some upon some certain herbs and flowers, but boldly and disorderly creep over all, and tast of all plants and trees indifferently, and live as they list.

Topsell, History of Serpents (1608), p. 105.

That which the *palmerworm* hath left hath the locust eaten. *Joel* i. 4.

palmetto (pal-met'ō), *n.* [Formerly *palmito*; < *Sp. palmito* (= *Pg. palmito* = *It. palmisto* = *F. palmiste*), dim. of *palma*, palm: see *palm*².] Any one of several fan-leaved palms of different genera. The one most properly so called is *Sabal palmetto*, the cabbage-palm, a tree from 20 to 35 feet high, abounding on the southeast coast of the United States. It forms part of the device in the seal and flag of South Carolina, the Palmetto State. Its wood is not attacked by the teredo and is very durable under water, and is therefore much used for piles and wharves. The fibrous leaves of this and the dwarf palmetto, *S. adansonii*, are made into hats, baskets, and fans, and also furnish an upholstery material. The palmetto, or hemp-palm, of southern Europe and North Africa, is *Chamaerops humilis*, a dwarf species, affording abundant fiber, consumed chiefly as "vegetable horsehair." The same names are given to the Chi-

Palm Sunday (pām sun'dā). The Sunday next before Easter, being the sixth Sunday in Lent and the first day of Holy Week. Its observance, in commemoration of Christ's triumphal entry into Jerusalem, is as old as the fourth century in the Eastern Church, and as the fifth or sixth century in the West. By the sixth or seventh century formal processions had become customary, which the Greek and the Roman Catholic churches have retained. The popular observance of the day by carrying branches of willow or other trees continued in many places in England after the Reformation, and the custom of solemnly blessing and distributing palm and other branches and carrying them in procession has been revived in many Anglican churches.

The labial palpi are two in number, rising either from the ligula or from the edge of the mentum; the maxillary palpi are placed one on the outer side of each maxilla. Besides these, certain *Coleoptera* have a second, two-jointed, palpaliform appendage on each maxilla, formed by a modification of the galea or external lobe. The palpi vary much in form and in the number of joints, which is never more than six; they are sometimes aborted or entirely absent, as in the *Hemiptera*. In the *Lepidoptera* this term is commonly restricted to the large labial palpi, the much smaller maxillary ones being designated as *palpicil*. The palpi are supposed by some to be organs of taste or touch. In the spiders the maxillary palpi are greatly developed, forming the pedipalps; these, in the scorpions, become chelate appendages, commonly called the front legs. Small palpi are also developed from the mandibles and maxillae of certain crustaceans. pangensis (pan-jen'e-sis), *n.* [NL., < Gr. πᾶς (*pas*), all, + γένεσις, production.] A provisional hypothesis advanced by Darwin to explain the phenomena of reproduction in organisms. It rests on the assumptions that the organic units (cells) of which an organism is composed differ from one another according to the function of the organ to which they belong; that they undergo multiplication by budding or proliferation, giving rise to minute gemmules, which are diffused to a greater or less extent throughout every part of each organism; that these gemmules possess the properties which the unit had when they were thrown off; and that when they are exposed to certain conditions they give rise to the same kind of cells from which they were derived. The name is also applied to the theory or doctrine that every organism has its origin in a simple cell called a *pangenic cell*.

I venture to advance the hypothesis of *Pangensis*, which implies that every separate part of the whole organism reproduces itself. So that ovules, spermatozoa, and pollen-grains—the fertilized egg or seed, as well as buds—include and consist of a multitude of germs thrown off from each separate part or unit.

It consists of four perforated limbs or rules, *a, b, d, e*, of wood or metal, arranged in pairs, joined together at the crossing, the two pairs being also

Pantograph.

a, b, d, e are rules perforated with a series of holes placed at graduated distances for adjustment to different scales for enlargement or reduction of the picture to be transcribed; *a* and *b* are permanently but movably joined at *c* to a traversing support; *d* and *e* are similarly joined at *h* to a pencil-holder or point-holder; *f* and *g* are thumbscrews which act as pivots for joining *a* and *d* and *b* and *e*. The rule *a* is pivoted to a support which is fixed to the drawing-table; *g* is a stylus attached to the end of the rule *b*. Lines traced by *g* will be also drawn by *h* on a larger or smaller scale corresponding to the adjustment.

joined together at *c* and *h*. The perforations are made at uniform distances, in accordance with a scale of measurement. The pivoted joints by which the two pairs are connected are constant, while the joints between the intersecting limbs of each pair may be shifted by inserting the joint-pins *f* in different holes in each limb. By changing the pins the copy may be reproduced on any scale either larger or smaller than the original, or it may be kept of the same size, the proportion being indicated for convenience by figures on the limbs (not shown in the cut). In use, the end and pivot *i* is fixed to the table, the pivot *c* sliding on the plane surface according to the impulse given to it. The pivot *g* carries a tracing-point which is passed over the original lines to be reproduced, and the pivot *h* carries a pencil or needle which traces the copy or pricks it in the paper. The pantograph is used for transferring patterns to calico-printing cylinders, in some processes of wood-carving, in making wooden type, etc.—**Polar pantograph**, a modification of the pantograph arranged for reproducing profiles of curved figures, as the tread of a car-wheel, the interior of a bell, or any other irregular form. When the point of the instrument is placed against the tread of a car-wheel, and is moved over it, the other arm reproduces a tracing that is an exact copy of the tread, showing such flattened places as may have resulted from wear, and such other irregularities as are present.

The fibers most used for writing-papers are those of linen and cotton rags, and for printing-papers those of straw, wood, paper-cuttings or paper-waste, and selected grasses. These fibers are prepared by grinding, bleaching, beating, and boiling until they are reduced to a fluid pulp, in which state they readily mat or felt together when freed from the water in which they are suspended. More than 400 varieties of fibers usable for this purpose are known: all have curling filaments that readily interlace with one another. Paper was formerly made wholly by hand, pulp from the vat being dipped up in a mold, from which the water drains away, leaving a felted sheet, which is then pressed and dried. Some fine grades of writing, printing, and drawing-papers are still made in this way, but the larger part of the paper, for whatever purpose used, is now made by machinery. For some purposes, as newspaper-printing, the sheet is made in continuous webs of very great length, and is printed from the uncut roll. Paper is made in a great variety of qualities, ranging from heavy drawing-board to the lightest tissue-paper, and in every color and shade. It is cut for the trade by accurate machines in a number of sizes, the sheets varying somewhat according to fashion or special requirements. (See list of sizes given below.) Paper is also molded from the pulp into cartridge-cases, embossed sheets for wall-decoration, pails, boxes, and other vessels, boats, barrels, car-wheels, domes for observatories, bricks, building materials, etc., in all of which lightness is combined with strength. From the sheet it is transformed by various processes and operations into roofing material, carpets, bags, etc. The principal varieties of ordinary paper are—writing- and printing-papers, coarse papers for wrapping and other purposes, and blotting- and filtering-papers; while some useful kinds are the result of manipulations subsequent to the paper-maker's work, as lithographic paper, tracing-paper, etc. The ordinary kinds of paper are the quire of twenty-four sheets, the ream of twenty quires (of which two are inferior to the other eighteen), and the bundle of two reams.

A sheet of transfer-paper is laid upon the object; on this is laid a sheet of paper, and, after the object has been heated, the paper is removed, and the lines of the design are then passed over with a hard point, which causes the pigment of the transfer-paper to adhere, along the lines passed over, to the object under treatment.—*Tab-sized paper*, paper made by dipping each sheet in a tub that contains prepared animal sizing.—*Turneric-paper*, paper dipped into a hot infusion of turmeric strong enough to give the paper a pronounced yellow color, and dried; used as a test of alkalinity or acidity.—*Vellum paper*, a heavy, uniform paper, showing no grain, and having a very smooth and fine surface. It is used for some of the finest printing.—*Waxed paper*, paper on which beeswax has been rubbed and melted by means of a hot iron: useful from its impermeability to water.—*Whitman paper*, an excellent brand of English paper, made in different qualities, with fine or coarse grain. It is used by draftsmen and aquarellists, printers of engravings, photographers, etc.—*Wove paper*, paper laid on flannels or felts and showing no marks of wires.—*Wrapping-paper*, a more or less coarse paper used for wrapping, varying in color usually from pale buff to brown, made from unbleached manila or old rope. In making such negatives, the dry gelatinobromide emulsions are especially used, and the operations of development, etc., are performed in the same way as for a negative on glass. The finished negative is rendered translucent, a usual method being to oil it with castor-oil, removing the superfluous oil by pressing with a hot iron; it can then be printed from in the same manner as a glass plate. It is important that the paper used shall be homogeneous and free from grain. Such negatives are convenient from their lightness and unbreakableness.

By most entomologists the name is now restricted to swallow-tailed butterflies having ample wings, triangular fore wings, hind wings concave next to the body and usually extended behind into a tail before the anal angle, and outer margin of hind wings dentate, with the teeth quite prominent near the tail. The genus is distributed of world-wide distribution, with about 350 species. The common yellow and black butterfly of North America, *P. turanus*, is a good example. Another is the common swallow-tailed butterfly of Europe, *P. machaon*, with long antennae, very short palpi, and the hind wings tailed. They have broad wings erect in repose, the hind wings concave along the abdominal border, slender antennae with the knob straight or scarcely curved, slender body, and six functional legs of which the first pair is of normal size and directed forward. The larvae are smooth or only moderately pilose, never spinose, erect in repose, the hind wings concave along the abdominal border, slender antennae with the knob straight or scarcely curved, slender body, and six functional legs of which the first pair is of normal size and directed forward. It. *para*, < *Gr. παρὰ*, prefix, *παρά*, prep., at the side, beside; with *gen.*, from the side of, from beside, from; with *dat.*, at the side of, beside, alongside, by; with *acc.*, prop. to the side of, hence by the side of, beside, near, by, etc.; as a prefix in the same senses; cf. Skt. *parā*, away, *param*, beyond; *L. per*, through, *Oscean perum*, without; AS. and E. *for*, *fore*, etc.; see *for*, *fore*, *per*, etc.] A prefix of Greek origin, meaning 'from beside', 'beside', 'near', 'by', etc. See etymology. It often denotes correspondence of parts. It is used in the formation of new scientific terms, but is not regarded as an established formative in English. In chemistry the prefix signifies close relation, as in *paraldehyde*, a polymer of aldehyde, or that a compound is formed from benzene by substituting other elements or radicals for two hydrogen atoms in the benzene ring, and that these atoms have an opposite position in the ring. (See *ortho* and *meta*.) In biology it indicates comparison with something else, yet a distinctness or difference therefrom in one of many or various ways. In pathology it signifies a condition differing in quality from normal.

Huxley, Anat. Invert., p. 508.

parabasis (pa-rā-bā'sis), *n.* [NL., < *Gr. παράβασις* (as def.), < *παρά*, beside, + *βάσις*, a stepping, step, < *βαίνω*, walk, step.] The chief of the choral parts in ancient Greek comedy.

It was sung by the chorus, usually divided into four rows of six and moving backward and forward facing the audience, during an intermission in the action, and while the actors were off the stage. It was written for the most part in anapestic tetrameters, and consisted, in fact, of an address from the poet to the public, giving his views and advice on affairs of state, as well as, often, his personal interests and claims for recognition or reward. The parabasis was regularly divided into six rhetorical parts, which were again subdivided; but any of these parts might be omitted or modified. It continued in the fully developed comedy the tradition of the Bacchic processions in which Greek comedy had its origin.

Something similar in purpose to the parabasis was essayed in one, at least, of the comedies of Beaumont and Fletcher, and in our time by Tiedke.

Love, Study Windows, p. 218.

The distinctive feature of Old, as compared with Middle Comedy, is the parabasis, the speech in which the chorus, moving towards and facing the audience, addressed it in the name of the poet, often abandoning all reference to the action of the play.

parabola¹ (pa-rab'ō-lā), *n.* Same as *parabole*.

Poesie*, p. 205.

parabola² (pa-rab'ō-lā), *n.* [= *F.* *parabole* = *Sp.* *parábola* = *Pg.* *it. parabola*, < *NL.* *parabola*, a parabola, < *Gr.* *παράβολη*, a parabola (see *def.*), so called by Apollonius of Perga, lit. 'superposition,' < *παράβαλλεν*, throw beside, compare: see *pare*¹.] 1. A curve commonly defined as the intersection of a cone with a plane parallel with its side. The name is derived from the following property. Let the figure represent the cone. Let *ABG* be the triangle through the axis of the cone. Let *DE* be a line perpendicular to this triangle, cutting *BG* in *H*. Let the cone be cut by a plane through *DE* parallel to *AG*, so that the intersection with the cone will be the curve called the parabola. Let *Z* be the point where this curve cuts *AB*. Then the line *ZH* is called by Apollonius the diameter of the parabola, or the principal diameter, or the diameter from generation: it is now called the axis. From *Z* draw *ZN* at right angles to *ZH* and in the plane of *ZH* and *AB*, of such a length as to make *ZT:ZA::BG²:ABAG*. This line *ZT* is called the latus rectum; it is now also called the parameter. Now take any point whatever, as *K*, on the curve. From *K* draw *KL* parallel to *DE*, meeting the diameter in *L*. *ZL* is called the abscissa. If now, on *ZL* as a base, we erect a rectangle equal in area to the square on *KL*, the other side of this rectangle may be precisely superposed

Parabola, as formed from cone.

upon the latus rectum, *ZT*. This property constitutes the best practical definition of the parabola. If a similar construction were made in the case of the ellipse, the side of the rectangle would fall short of the latus rectum; in the case of the hyperbola, would surpass it. The modern scientific definition of the parabola is that it is that plane curve of the second order which is tangent to the line at infinity. The parabola is also frequently defined as the curve which is everywhere equally distant from a fixed point called its focus, and from a fixed line called its directrix. The normal to a parabola at every point on the curve bisects the angle between the line parallel to the axis and the line to the focus. See also *cut* under *conic*.

2. By extension, any algebraical curve, or branch of a curve, having the line at infinity as a real tangent. Such a curve runs off to infinity without approximating to an asymptote. If the branch has an asymptote at one end but not at the other, it is not commonly termed a parabola.—Bell-shaped, biquadratic parabola. See the adjectives.—Campaniform parabola, a cubic divergent parabola without node or cusp.—Cartesian parabola, a plane cubic curve having the line at infinity a tangent at its crunode. See *trident*.—Cuspidal parabola, a parabola, a parabola of the third order—that is, such that every line in the plane meets it in three points, one at least real, though it may be at infinity; especially, the curve better described as the central *cuspidal parabola*, which has a cusp on the axis of symmetry, and the normal at its inflection passing through the cusp. There is also a non-plane curve so called.—Cuspidate parabola, a parabola having a cusp.—Divergent parabola, a plane curve having the line at infinity as an inflectional tangent.—Double parabola, a plane curve of the third class, having the line at infinity for a double tangent.—Helicoid parabola. See *helicoid*.—Median parabola, the semicubical parabola, which was rectified, before any other curve, by Wm. Neil in 1657.—Nodate parabola, a parabola having a crunode.—Oval parabola, a parabola having an oval.—Plane cubic parabola. See *cubic*.

Those books of the Bible called First and Second Chronicles are also called *Paralipomena*, formerly *Paralipomenon* (a genitive form, see above).

parallactic (par-a-lak'tik), *a.* [= *F. parallactique* = *Sp. parallactico* = *Pg. parallactico* = *It. parallattico*, < *LGr. παραλλακτικός*, of or for the parallax, < *Gr. παράλλαξις*, parallax: see *parallax*.] Of, pertaining to, of the nature of, or characterized by parallax.

Thomas Digrey and John Dey, gentlemen and mathematicians amongst us, have lately proved by *parallactic* doctrine that it [a new star in Cassiopeia] was in the celestial, not in the elementary region.

Holland, in *Camden* (Elizabeth, an. 1572).

Parallactic angle. (a) The angle whose vertex is at any object observed while its less part was through a mean and an extremely removed station of observation; parallax. (b) The angle between the vertical circle and the declina-

tion circle of a star.—**Parallactic ellipse**, the ellipse which a star appears to describe annually in consequence of the earth's revolution around the sun, and by virtue of parallax.—**Parallactic inequality**, an inequality in the moon's motion dependent upon the solar parallax at the moon. Its period is one synodical revolution, or 29.53 days, being double that of the variation, which it thus alternately increases and diminishes. The maximum effect on the longitude is 129".—**Parallactic instrument**, in *astron.*, an equatorial instrument.—**Parallactic rules**, an ancient astronomical instrument for measuring the zenith-distance of a star.—**Parallactic unit**, the distance of a star whose parallax is 1", being 206,265 times the distance of the sun from the earth.

parallactical (par-a-lak'ti-kal), *a.* [*Gr. parallaktikos* + *-al*.] Same as *parallactic*.

parallax (par'a-laks), *n.* [= *F. parallaxe* = *Sp. paralaje*, *paralajis* = *Pg. parallaxe* = *It. paralasse*, < *Gr. παράλλαξις*, alternation, parallax, < *παράλλασσεν*, make things alternate, < *παρά*, beside, + *ἄλλασσεν*, change, < *ἀλλά*, another.] 1. An apparent displacement of an object observed, due to real displacement of the observer, so that the direction of the former with reference to the latter is changed. In the cut, the angle BCD, being the semidiameter of AB as seen from C, is the parallax of C as seen from B. In astronomy, parallax is due either to our daily motion round the center of the earth, or to our yearly motion round the sun. Parallax is observed, also, when the head is moved before two images or other objects in the region of distinct vision and at unequal distances. There is also an effect of parallax when we alternately shut one eye and open the other.

2. In *optics*, an apparent shifting of the spider-lines in a telescope-reticle as the eye is moved before the eyepiece: it is due to the non-coincidence of the threads with the focal plane of the object-glass.—**Angle of parallax**, in *physiological optics*, the angle which the visual axes form at their point of meeting. This angle becomes greater the nearer the point of fixation.—**Annual parallax**, the displacement of a star owing to its being observed from the earth instead of from the sun.—**Diurnal parallax**, the displacement of a body owing to its being observed from the surface instead of from the center of the earth.—**Horizontal parallax**, the diurnal parallax of a star upon the horizon. The horizontal parallax is equal to the semidiameter of the earth as seen from the star.—**Parallax of altitude**, the angular amount by which the altitude of the moon or other heavenly body is less on account of parallax.

parallel (par'a-lél), *a.* and *n.* [*OF. parallele*, *F. parallele* = *Sp. paralelo* = *Pg. parallelo* = *It. parallelo*, *parallello*, < *L. parallelus*, *parallellos*, < *Gr. παράλληλος*, beside one another, < *παρά*, beside, + *ἄλληλος*, gen., etc. (found only in oblique cases of dual and plural), one another, a duplicated form, < *ἄλλος*, another, + *ἄλλος*, another.] 1. *a.* 1. In *geom.*, of lines (according to Euclid in his definition of parallel straight lines), lying in the same plane but never meeting however far they may be produced in either direction; of planes, never meeting however far they may be produced; in modern geometry, intersecting at infinity. The definition of Euclid is the traditional one; but the modern definition has three logical advantages: first, it is not, like the Euclidean definition, a negative one; second, it makes one conception applicable equally to parallel lines and parallel planes; and third, it is a statement which, whether literally true or not, must be admitted in form for the sake of the important generalizations which result from it.

2. Having the same direction, tendency, or course. How am I then a villain To counsel Cassio to this parallel course, Directly to his good? *Shak.* *Othello*, II. 3. 355.

3. Continuing a resemblance through many particulars; like; similar; equal in all essential parts: as, a *parallel case*; *parallel passages* in the Evangelists.

He [the apostle Paul] goes up and down preaching the Gospel in a sphere as large as his mind was, and with a zeal only parallel with his former fury. *Stillingfleet*, *Sermons*, I. iv.

4. In *music*: (a) Of two voice-parts, progressing so that the interval between them remains the same. Such progression is called *parallel motion*, and the intervals by which the two parts are separated are called *parallel intervals*. When the interval is a unison, an octave, or a perfect fifth, the progression is regarded as faulty: such progressions are called *parallel unisons*, *octaves*, or *fifths*, or simply *parallels* or *consecutions*. Parallel thirds and sixths are correct, and pleasing when not too long continued. Parallel seconds and sevenths are rare, and usually objectionable. (b) Of tonalities, same as *relative*.—5. In *entom.*, parallel-sided: as, *parallel elytra*, wings, etc.—**Parallel bars**, *battle*,

brake-hanger. See *bari*, etc.—**Parallel circles** on a sphere, circles whose planes are parallel.—**Parallel circuit**, an electrical conductor joining two points which are also connected by another conductor, to which the first is then said to be parallel.—**Parallel coping**, in building, coping of equal thickness throughout; used to copelined surfaces, such as gables, etc.—**Parallel curves** and surfaces, those curves and surfaces which have the same normal, and are therefore everywhere equidistant.—**Parallel extinction.** See *extinction*, 3.—**Parallel file.** See *file*.—**Parallel fissure** or *sulcus*, the superior temporal fissure, parallel to the fissure of Sylvius. See *fissure*.—**Parallel forces**, forces which act in directions parallel to each other.—**Parallel hemisidrum.** See *hemisidrum*.—**Parallel intervals.** Same as *consecutive intervals* (which see, under *consecutive*).—**Parallel key, knife, lathe.** See the nouns.—**Parallel lines.** (a) Defined by Euclid as "straight lines which are in the same plane and, being produced ever so far both ways, do not meet." (b) *Milit.*, same as *parallel*. See *IL*, 5.—**Parallel motion.** (a) A contrivance for converting reciprocating circular motion into rectilinear reciprocating motion by the use of link-work. The ordinary parallel motion, that of Watt, fulfils its function to a close degree of approximation, but not exactly. It is designed to cause the piston-rod in imparting motion to, and the pump-rod in taking motion from, the oscillating beam of a steam-engine to move respectively in very nearly right lines, and is sufficiently perfect for all practical purposes. It depends upon the principle that when the ends of two levers connected by a link oscillate on different centers in the same vertical plane, describing arcs convex toward each other, there is some point in the connecting-link that must move in nearly a right line. The position of this point depends upon the lengths of the levers and the relative positions of their fulcrums. A method for mathematically locating this point has been given by Rankine. In the diagram the ends of the equal levers *gh* and *ij* describe arcs convex toward each other, *a* is the connecting-link; *g* and *j* are the fulcrums. The piston-rod is connected at *c* to the link *c*; and when the levers are caused to oscillate, one end of the link *a* is drawn to the right, while the other is moved to the left, causing the point of connection, and also the pump-rod *ij* and piston-rod *c*, to move in nearly right lines. The first exact parallel motion discovered, after immense labor by many mathematicians, was Peaucellier's cell. (See *cell*.) The simplest is the Kempe-Sylvester parallel motion. (b) In music. See *motion*.—**Parallel perspective, rod, etc. See the nouns.—**Parallel roads**, benches or terraces on hill-slopes, indicating former levels at which the water stood in the valley beneath at a time when this was occupied by a lake, or a lake-like expansion of a river. The phrase *parallel roads* is chiefly used with reference to the so-called Parallel Roads of Glenroy in Scotland, in regard to which there has been much discussion among geologists. See *terrace*.—**Parallel rulers**, an instrument for plotting courses on a chart, or for drawing parallel lines for other purposes. It consists of two rulers connected by cross-bars of equal length, movable about joints, so that while the distance between the two rulers may be increased or diminished, their edges always remain parallel.—**Parallel sailing, sphere, etc. See the nouns.—**Parallel suns.** See *parallel*.****

In parallel, a method of connecting electric batteries or dynamos in which all of the positive poles are joined to one extremity of the circuit-wire, and all of the negative to the other. (See *battery*.) The connection is said to be in series when the positive pole of one cell or machine is joined to the negative of the next.—**Mundane parallel**, in *astrology*, situation at equal distances from the meridian.—**Parallels of altitude**, in *astronomy*, small circles of the sphere parallel to the horizon. Also called *almucantars*.—**Parallels of declination**, small circles of the celestial sphere parallel to the equator.—**Theory of parallels**, the geometrical discussion of the number of lines which can be drawn through a given point parallel to a given line, with other kindred matters. The fifth postulate (in some modern editions the eleventh axiom) of Euclid reads, "And if a right line incident upon two right lines make the two interior angles on the same side less in sum than two right angles, then those two right lines will meet on the side on which the angles are less than two right angles if produced to infinity." This proposition being much more complicated than any other assumed by Euclid without proof, a great number of attempts were made by mathematicians to demonstrate it. Finally, it was conclusively shown, as Gauss expressed it, that we have no reason to believe that the celebrated postulate is more than approximately true. There are thus three possible systems of geometry, the Euclidean and two non-Euclidean systems, according as it is assumed that there can be drawn through any given point, parallel to any given line, only one line, two real lines, or two imaginary lines.—**Zodiacal parallel**, in *astrology*, the situation of two planets at the same distance from the equator.

The impairment of the normal capacity of the nervous system for bringing into action one or more active organs, muscular or glandular, or for receiving impressions along one or more sensory paths. Motor paralysis is called *akinesia*, sensory paralysis *anesthesia*. When the peripheral organ is the seat of gross destructive disease the term *paralysis* is not employed, but it is used for finer changes which set these organs out of action, as in some cases of muscular paralysis. One of the unjointed lateral locomotor processes or series of foot-stumps, foot-tubercles, or rudimentary limbs of many worms, as annelids. Parapodia exhibit the greatest diversity in the extent to which they are developed at the sides of the successive segments of annelids, and also in their own sizes and shapes; and each parapodium—that is, the right or left foot-stump of any segment—may be divisible into a dorsal and a ventral part, the former of which is a notopodium, the latter a neuropodium. The term is generally used in the plural, referring either to the right and left parapodia of any one segment or to the series of successive parapodia. The processes are so called because they are lateral in position, projecting from the sides of the worm. It is the increasing intensity of light in the morning which induces the waking of the leaves, and the decreasing intensity in the evening which induces the closing or nocturnal position of the leaves, whereas in the heliotropic curving of motile organs it is the constant influence of light which effects the turning. As employed by other vegetable physiologists, the word implies also the retarding influence of light upon growing organs, in distinction from the *phototropic* or stimulating effect upon leaves. That is, in leaves exposed for a protracted period to darkness the growth is arrested, but they have the power of growth restored on exposure to light, whereas all growing organs grow more rapidly in darkness than in light, this effect of light in retarding growth being termed the *paratonic effect*.

To remit the penalty or punishment due on account of (an offense); pass by or leave without penalty, resentment, or blame; forgive; overlook.

As any man has power to wrong me.

Blackstone, *Com.*, IV. xxxi.

2. To absolve (an offender) from liability for an offense or crime committed; release (a person) from the punishment or penalty due on account of some fault or offense.

Dispute betwixt myself and mine.

Tennyson, *Princess*, i.

=Syn. *Pardon*, *Forgive*. These words are often synonymous. Strictly, *pardon* expresses the act of an official or a superior, remitting all or the remainder of the punishment that belongs to an offense: as, the queen or the governor pardons a convict before the expiration of his sentence. *Forgives* refers especially to the feelings; it means that one not only decides to overlook the offense and re-establishes amicable relations with the offender, but gives up all ill feeling against him. See *pardon*, *n.*

pardon (pär'don or -dn), *n.* [*< ME. pardoun*, *pardon*, *pardun*, *< OF. pardoun*, *pardun*, F. *pardon* = Sp. *perdon* = Pg. *perdoar* = It. *perdono*, *< ML. perdonum*, indulgence, pardon; from the verb.] 1. 2. In law, a free remission of the legal consequences of guilt or of some part of them; an act of grace proceeding from the power charged with the execution of the laws, which exempts the individual on whom it is bestowed from the punishment the law prescribes for a crime he has committed. *Marshall*. Mere mitigation of

punishment is not pardon. *Pardon* is sometimes used in the more general sense which includes *amnesty*. In Great Britain the pardoning of offenses against the crown or the people rests with the crown, except in certain specified cases. Pardon is granted under the great seal or by warrant under the sign manual, countersigned by one of the principal secretaries of state, or by act of Parliament. Offenders against the laws of the United States may be pardoned by the President, except in cases of impeachment. In nearly all the States, persons convicted of crimes under the State laws, except in cases of treason and impeachment, may be pardoned by the governor, the governor and council, or the governor and board of pardons.

John Hunne had his *Pardon*, and Southwel died the Night before he should have been executed.

Baker, *Chronicles*, p. 187.

3. The deed or warrant by which such remission is declared. Delivery is essential to its validity, and delivery is not complete without acceptance; but in some cases constructive acceptance has been held sufficient, as where it was delivered to the jailer, the prisoner being ignorant of it.

4. A papal indulgence, or remission of the temporal punishment due to sin, usually for a stated time.

De le and do penance day and nyght evere,
And purchase al the *pardon* of Paumpelon and of Rome,
And indulgences ynowe.

To quicken the faithful in the discharge of such a brotherly kindness, our old English bishops often granted a ghostly reward—an indulgence or, as it was then better called, a *pardon* of so many days—unto all those who with the fitting dispositions should answer this call made to them from the grave, and pray especially for him or her who lay buried there.

Quoted in *Rock's Church of our Fathers*, III. i. 72.

No youth can be comely but by *pardon*, and considering the youth as to make up the comeliness.

Bacon, *Beauty*.

To beg, crave, or ask one's pardon, to ask one's forgiveness: a phrase corresponding in its use to *pardon me* (which see, under *pardon*, *n.*) =Syn. *Pardon*, *Abolition*, *Remission*, *Amnesty*. All these words represent a complete work with reference to the offense, so that it becomes as though it had not been committed. *Pardon* is the general word (see comparison under *pardon*, *v. t.*). *Abolition* is now strictly an ecclesiastical word, as defined. *Remission* is, by derivation, a letting go, a sending away; "remission of sins" is a frequent Biblical expression; outside of Biblical language, we speak chiefly of the *remission* of penalty: as, the *remission* of a fine or of part of a term of imprisonment. *Amnesty* is strictly a political word, as defined, covering a general pardon of persons, named or unnamed, who have become exposed to penalty by offenses against the state or the sovereign. We speak of *pardon* of the offense or the person; *abolition* of the person from the offense; *remission* of sin or of penalty for the person; *amnesty* to all concerned in the insurrection.

Such persons would be within the general pardoning power, and also the special provision for *pardon* and *amnesty* contained in this act. Lincoln, in Raymond, p. 202.

The blackest sin is clear'd with *abolition*.

"That is *peeled* which is deprived of a natural layer or integument spread over it." (*C. J. Smith, Synonyms Discriminated*, p. 603.) The figurative uses of these two words are limited. *Shave* or *shave off* still seems figurative when not implying the use of a razor, and is controlled in its meaning by that original

sense; hence it is always limited to dressing off the surface.

The genuine is regarded as a mild tonic, aperient, and diuretic, but its chief use at present is to relieve chronic diseases of the urinary passages. *Pareira-root* is the official drug, but *pareira-bark* has probably something of its virtue. (c) The general substance of the interior of the parenchymatous worms.—2. In *bot.*, the fundamental cellular tissue of plants: contradistinguished from *prosenchyma*, or fibrovascular tissue. It is the soft thin-walled tissue, with approximately isodiametric cells, which composes the soft pulp of leaves between the network of veins, the pulp of fruits, etc. In a dicotyledonous stem it forms the outer bark, the pith, and the medullary rays; in monocotyledons it is the common mass, of loose texture, through which the definite fibrovascular bundles are distributed. While the ordinary or typical shape of the cells is polyhedral or spherical, there are numerous modifications, all of which formerly received special designations, but only a few principal types are now distinguished by names. Spongy parenchyma is tissue in which the cells are loosely aggregated and have large intercellular spaces. Elongated parenchyma-cells are more compactly combined than short ones, and in the upper side of leaves have received the significant name of *palisade-cells*. Flattened parenchyma-cells are seen in the medullary rays of dicotyledons. Collenchyma, sclerotic and suberous parenchyma, trichomes, etc., are further modifications. See *collenchyma*, *palisade-cell*, *sclerotic*, *suberous*, *trichome*, and cuts under *cellular*, *cytoblast*, and *tissue*.

An explanatory or qualifying clause, sentence, or paragraph inserted in another sentence or in the course of a longer passage, without being grammatically connected with it. It is regularly included by two upright curves facing each other (also called *parentheses*), or the variant form of them called *brackets*, but frequently by dashes, and even by commas. The quotation from Dryden given below contains a parenthesis.

In phonetic discussions (Ellis, Sweet, etc.) the curves are often used for a similar purpose, to indicate that the letters of the words so inclosed have a fixed phonetic value, according to a system previously explained. The curves are also used to inclose small marks and letters, and figures of reference, in order to make them more distinct to the eye.

lia are seen at the same time; and variously arranged white circles, arcs, and bands intersect the halo, or lie tangent to it at the same points. Halos are produced by the refraction of rays through suspended ice-crystals which tend to fall in one or more special positions, and parhelia are due to the excess of crystals so situated. When the sun is near the horizon and the ice-prisms in a vertical position largely preponderate, parhelia are formed on the halo both to the right and left of the sun, and at the same level. As the sun rises, the parhelia gradually separate outward from the halo. If there is an excess of hexagonal prisms with their axes horizontal, and if the axes of the prisms are perpendicular to the line joining the sun and the observer, parhelia will be produced which will be situated on the halo above and below the sun.

"The only way," then said the host, . . .

"Is to seek him among the parks,

Killing of the kings deer."

Robin Hood and the Tinker (Child's Ballads, V. 235).

A park is an enclosed chase extending only over a man's own grounds. The word park, indeed, properly signifies an enclosure; but yet it is not every common field or common which a gentleman pleases to surround with a wall or paling, or to stock with a herd of deer, that is thereby constituted a legal park; for the king's grant, or at least immemorial prescription, is necessary to make it so.

2. A meeting or assembly for conference or deliberation; especially, an assembly of the people or their representatives to deliberate or legislate on national affairs. The word is nearly confined to the legislative bodies of Great Britain and its colonies. Specifically—3. [*cap.*] The supreme legislative body of the United Kingdom of Great Britain and Ireland, consisting of the three estates of the realm, namely the lords spiritual, the lords temporal, and the commons; the general council of the nation, constituting the legislature, summoned by the sovereign's authority to consult on the affairs of the nation and to enact and repeal laws. Primarily, the sovereign may be considered as a constituent element of Parliament; but the word as generally used has exclusive reference to the three estates above named, ranged in two distinct branches, the House of Lords and the House of Commons. The House of Lords includes the lords spiritual and lords temporal (See *House of Lords*, under *lord*). The House of Commons consists of 670 members; viz., for England and Wales, 253 representatives of county constituencies (counties or divisions of counties), 237 of boroughs, and 5 of universities; for Scotland, 39 representatives of counties, 31 of burghs, and 2 of universities; for Ireland, 85 representatives of counties, 16 of boroughs, and 2 of universities. The authority of Parliament extends over the United Kingdom and all its colonies and foreign possessions. The duration of a Parliament was fixed by the Septennial Act of 1716 at seven years, but it seldom ever approaches its limit. Sessions are held annually, usually from about the middle of February to the end of August, and are closed by prorogation. Government is administered by the ministry (see *ministry and cabinet*), which is sustained by a majority in the House of Commons. Should the ministry be outvoted in the house on a question of vital importance, it either resigns office or dissolves Parliament and appeals to the country. The precursors of the Parliament were the Witenagemot in the Anglo-Saxon period and the National Council in the Norman and Angevin periods. The composition and powers of Parliament were developed in the thirteenth and fourteenth centuries; the right of representation from shires and towns dates from 1295, and the separation of the two houses dates from the middle of the fourteenth century. Parliamentary government was in large measure suspended from 1461 to the middle of the reign of Henry VIII. Prolonged struggles between the Parliament and the crown took place under James I. and Charles I., which led to the Civil War and the Commonwealth. The Triennial Act of 1694 (modified by the Septennial Act of 1716) fixed the life of Parliament at three years, and gave measure by party dates from the same period. The right of election to Parliament has been greatly modified by the Reform Acts of 1832, 1867, and 1884, and the Redistribution Act of 1885.

five years by the people of the different provinces, there being one representative for every 20,000 of the population. In the other colonies the two houses are usually styled the *Legislative Council* and the *Legislative Assembly*. The members of the latter body are elected; the members of the former body may be elected, as in Tasmania, or nominated by the crown, as in New South Wales.

more specific names. When used in a stricter sense, it usually refers to Old World birds of moderate or rather large size, of stout build, with strong beak, fleshy tongue, and short square tail, as in the restricted genus *Psittacus*, of which the African *P. erythacus*, of a gray color with a bright-red tail, is a characteristic example and one of the commonest of cage-birds. The natural cries of parrots are, as a rule, extremely loud and harsh; but many of the fleshy-tongued species can be taught to articulate words and even sentences in a perfectly intelligible manner. Most parrots are expert climbers, and in scrambling about use the bill as well as the feet, the upper mandible being peculiarly movable. The tongue in some species is also used as an organ of touch, almost of prehension, objects being often held and handled between the tip of the tongue and the hook of the beak. These birds are mostly vegetarian, feeding upon seeds and especially soft fruits, but some are carnivorous. Their temper is uncertain, though several kinds exhibit the most affectionate and gentle disposition, at least toward one another. In size and shape parrots differ greatly, more than is usual among the representatives of any one family of birds: some of the smallest species are no larger than sparrows, as those of the genus *Nasterna*, while the great macaws attain a length of about three feet. Their coloration is equally diversified: some are black or gray; some are snowy-white; green is the most characteristic color; yellow, red, and blue, often of the most brilliant tone, are very common; and many parrots are variegated with all these colors. The sexes are usually colored alike. Gaudiness of coloration reaches its extreme in the macaws, while the most beautiful and dainty tinting is common among the lorises and plain or somber shades are exceptional throughout the order. Of parrots of all kinds there are about 350 species, classed in from 25 to 100 genera according to the views of different ornithologists. They abound in all tropical countries, but seldom extend into temperate countries, except Australia and New Zealand. In round numbers, the geographical distribution of parrots is as follows: America is richest in species, having 150, only one of which occurs in the United States, though two or three others come nearly or quite to the Mexican border; the Moluccas and Papuan Islands have 80 species, Australia 60, and Polynesia 30; 25 are African; and 20 are peculiar to Asia. is suggested by its being followed by *in*, not *of*. *Share*

Parthenogenesis characterizes the reproduction of many insects, as aphids or plant-lice.

Agamogenesis is of frequent occurrence among insects, and occurs under two extreme forms; in the one the parent is a perfect female, while the germs have all the morphological characters of eggs, and to this the term *parthenogenesis* ought to be restricted.

Specifically—2. In law, the relation subsisting between persons who combine their services, property, and credit for the purpose of conducting business for their joint benefit. It involves usually a reciprocal agency and a community of profits and of losses, and often a community of interest in the capital. Since one in such a relation may make himself liable as a partner to pay debts, and yet fail to secure the right to share assets, the test of what constitutes a partner varies according as merely the relation of the parties to one another is considered, or their relation to third persons dealing with the firm. For the purpose of liability to third persons, a right to share in the profits as profits, as distinguished from receiving a compensation in proportion to profits, has been deemed the general test; but it is subject to exceptions and qualifications, and in England and some other jurisdictions the test is whether the relation was such that the one sought to be held liable had constituted the other his agent to contract such obligation.

3. The contract creating the relation of partners.—4. A rule in arithmetic. See *fellowship*.

4.—**General partnership**, a partnership in which the relation is not qualified as limited or special, and in which, therefore, all the members are jointly liable for all the debts.—**Limited partnership, or special partnership**, a partnership in which the special partner contributes to the common stock a specific sum in cash, and is liable for the debts of the partnership only to the amount of his investment. This immunity is secured by compliance with the statutes creating it, which usually provide that the special partner shall take no part in the conduct of the business.—**Mining partnership**, a partnership which exists when two or more persons, who own or acquire a mining-claim for the purpose of working it and extracting the mineral therefrom, actually engage in working the same: the chief peculiarity of the relation in this case is in the implied powers of the partners, and the fact that the transfer of the share of a partner to a stranger brings in the latter without dissolving the partnership.—**Universal partnership**, a form of association existing in Louisiana, in which all the partners agree to put in common all the wealth they have and may acquire. Exception, however, is now made of wealth acquired by gift, succession, or legacy after the partnership had been constituted.

part-owner (pär't'ö'nér), *n.* In law, a joint owner or tenant in common, who has an independent, although an undivided, interest in property with another or others.

Perdiz* = *It. pernice, perdrice*, < *L. perdix*, < *Gr. πέδις*, a partridge.] 1. A gallinaceous or rasorial bird of the family *Tetraonidae* and of one or

another of the subfamilies *Perdixinae*, *Caccabinae*, and *Ortyginae*, of small size as compared with grouse (*Tetraoninae*), with four toes, scaly shanks seldom spurred, fairly well-developed tail, and naked nostrils. (a) The birds more particularly designated partridges are the European species of the genera *Perdix* and *Caccabus*. The best-known of these is the common gray partridge, *Perdix cinerea*, the only bird of

Common Gray Partridge (*Perdix cinerea*).

the kind that is common in Great Britain, and hence the one specifically called *partridge* in English. It extends through Europe, and in Asia is replaced by closely related forms, as *P. barbara* and *P. hodgsoniae*. Other Asiatic birds which have *partridge* as at least the book-name are species of *Oreoperdix*, *Ammoperdix*, *Arborophila*, *Bambusicola*, etc. Those of the last-named genus are known as bamboo-partridges. (b) In Europe other birds properly called partridges are the chukar, the red-legged French, or Gurnsey partridge is *Caccabus rufa*; the Greek partridge is *C. græca*; the rock-partridges are *C. saxatilis* and *C. petraea*. Related to these in Asia and Africa are other species of *Caccabus*. Snow-partridges belong to the genus *Lerua* or *Tetraoperdix*, as *L. or T. nivicola*, and to *Tetraonallus*. Of the latter genus are the chukar, and (*T. caspius*), the Himalayan partridge (*T. himalayensis*), and other species. The rail partridges are a dozen or more species of *Arborophila*, found in India and countries further east, and several of *Galloperdix*. (See cut under *Galloperdix*.) The very numerous species of francolins are often brought under *Perdixinae*, and some of them are called black partridges. They are mostly African. (See cut under *francolin*.) (c) All the partridge-like birds of America are entirely different from any of the foregoing, and constitute a separate subfamily called *Colinae*, *Ortyginae*, or *Odontophorinae*; these are in different parts of the United States (as explained under *pheasant*) known as partridges or quails (quail being properly the name of the Old World birds of the genus *Coturnix*). The common partridge or quail of the United States is the Virginian bobwhite, *Coturnix virginiana*, and it is the only one that is extensively dispersed in the country. But in the southwestern States and Territories are found numerous other partridges or quails, of the genera *Oreortyx*, *Lophortyx*, *Callipepla*, and *Cyrtonyx*; while ranging through Mexico and Central America and well into South America are yet others, belonging to the genera *Erythrortyx*, *Dendroortyx*, and *Odontophorus*. See cuts under *Coturnix*, *Callipepla*, *Cyrtonyx*, *helmet-quail*, *Lerua*, *Odontophorinae*, *Oreortyx*, and *quail*. See also *grouse*.

In Australia, by misapplication, species of the family *Turnicidae*.—4. In New England, by misapplication, the ruffed grouse.—5.
